Atmosphere
Monitoring

COPERNICUS ATMOSPHERE MONITORING SERVICE

CAMS is one of six thematic information services provided by the Copernicus Earth Observation Programme of the European Union.

Implemented (and C3S) by ECMWF on behalf of the European Commission

Fire danger and flood forecasts provided to CEMS

PROGRAMME OF
THE EUROPEAN UNION

IMPLEMENTED BY

Atmosphere
Monitoring

WHAT IS THE SCOPE OF CAMS?

CAMS provides **consistent and quality-controlled** information related to air pollution and health, solar energy, greenhouse gases and climate forcing, everywhere in the world.

Air quality

Policy tools

Solar energy

Ozone layer and UV radiation

Emissions and surface Fluxes

Climate forcing

<http://atmosphere.copernicus.eu>

Atmosphere Monitoring

CAMS PORTFOLIO

Data About us What we do

New ADS is live! Please check our [informative page](#) to best prepare yourself to use the new ADS and watch further announcements on our [Forum](#).

We provide consistent and quality-controlled information related to air pollution and health, solar energy, greenhouse gases and climate forcing, everywhere in the world.

Today's air quality forecasts

Europe

Worldwide

CAMS on Air

Seasonal Atmospheric Recap

In Focus

Global carbon dioxide and methane monitoring

CAMS provides open & free information products based on Earth Observations about:

- past, current and near-future (forecasts) global and regional atmospheric composition;
- European air quality;
- Ozone layer monitoring;
- emissions and surface fluxes of key pollutants and greenhouse gases;
- solar radiation;
- climate radiative forcing.

Copernicus Emission Monitoring & Verification Support Service

Sattelite observations : a game changer ?

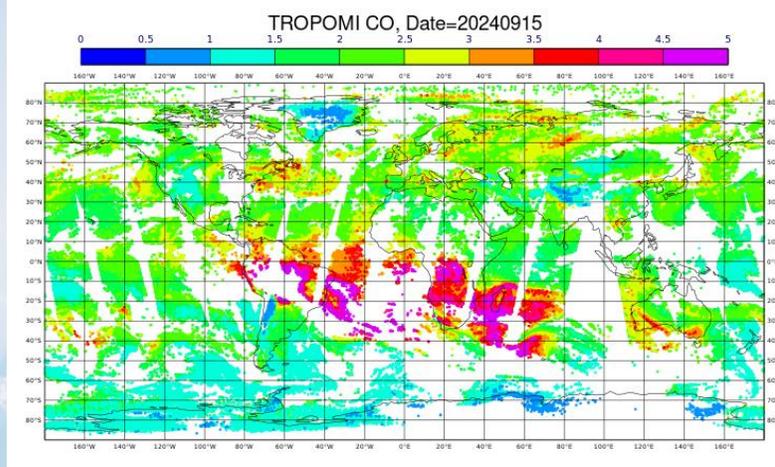

- To monitor areas that are not well covered by in-situ networks
- To monitor exceptional emission events and long-range patterns : dust plumes, wildfires, volcanoes eruptions
- To support emission reporting checking or detection of emissions sources (inverse modelling approaches)
- BUT :
 - Sattelites monitor columns or half-columns,
 - Need calibration processes to retrieve data
 - Revisit the same area “only” periodically,
 - Do not see anything in cloudyly conditions
- Availability of geostationnary sattelites monitoring atmospheric composition likely to be the most promising development to complement in-situ networks : TEMPO (US), GEMS(Korea), Sentinel 4 (Europe - 2025)

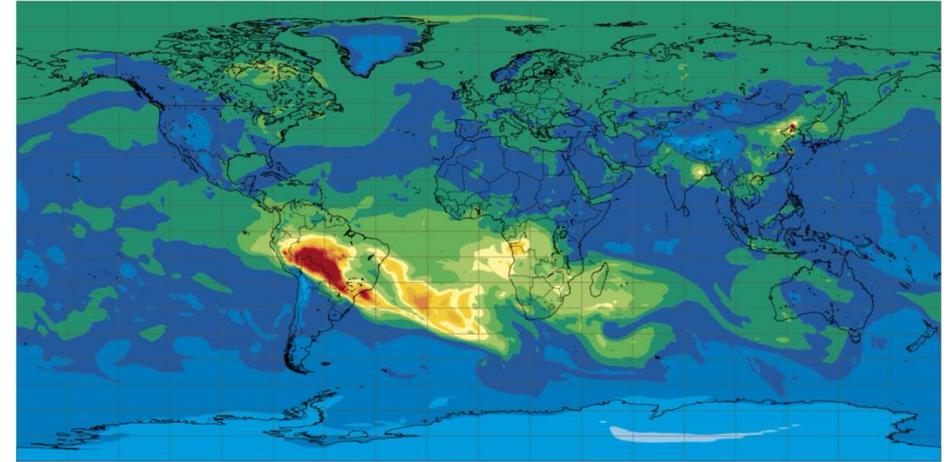

CAMS Global Forecasts – CO as example

Satellite observations (S-5p, MOPITT & IASI)

Carbon Monoxide forecasts

What do atmospheric data tell us? Aerosols

Total Aerosol Optical Depth at 550nm forecast initialized 15 Sept 00 UTC

What does the map tell us? Where is this aerosol coming from?

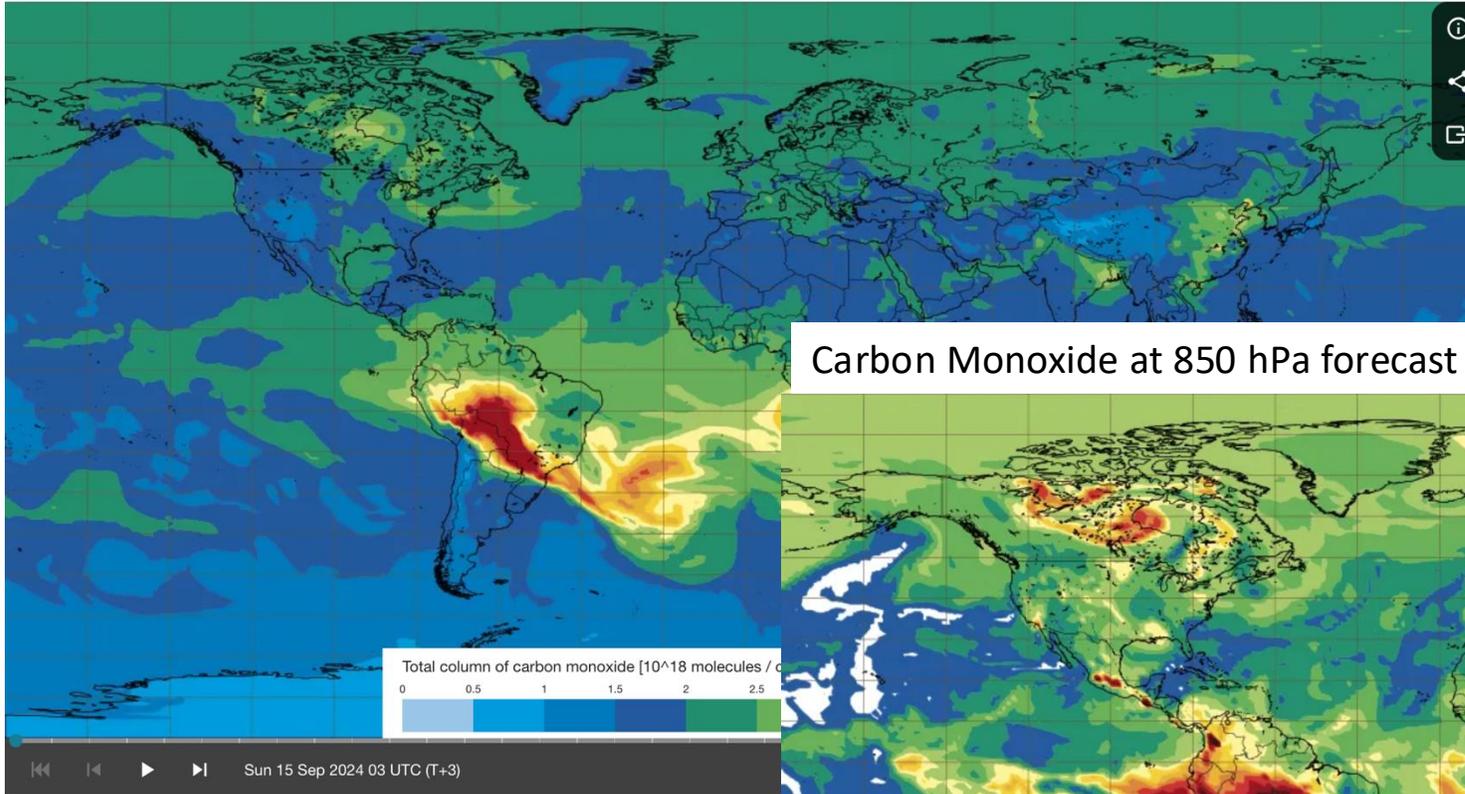

- Biomass burning (historic fires in the Amazon region, seasonal fires in tropical Africa)
- Mineral dust (dust belt extends from Sahara to east Asia)
- Sulphate aerosols (wildfires, volcanic activity, anthropogenic emissions)
- Sea salt (wind driven over the oceans)

What do atmospheric composition data tell us? Carbon monoxide

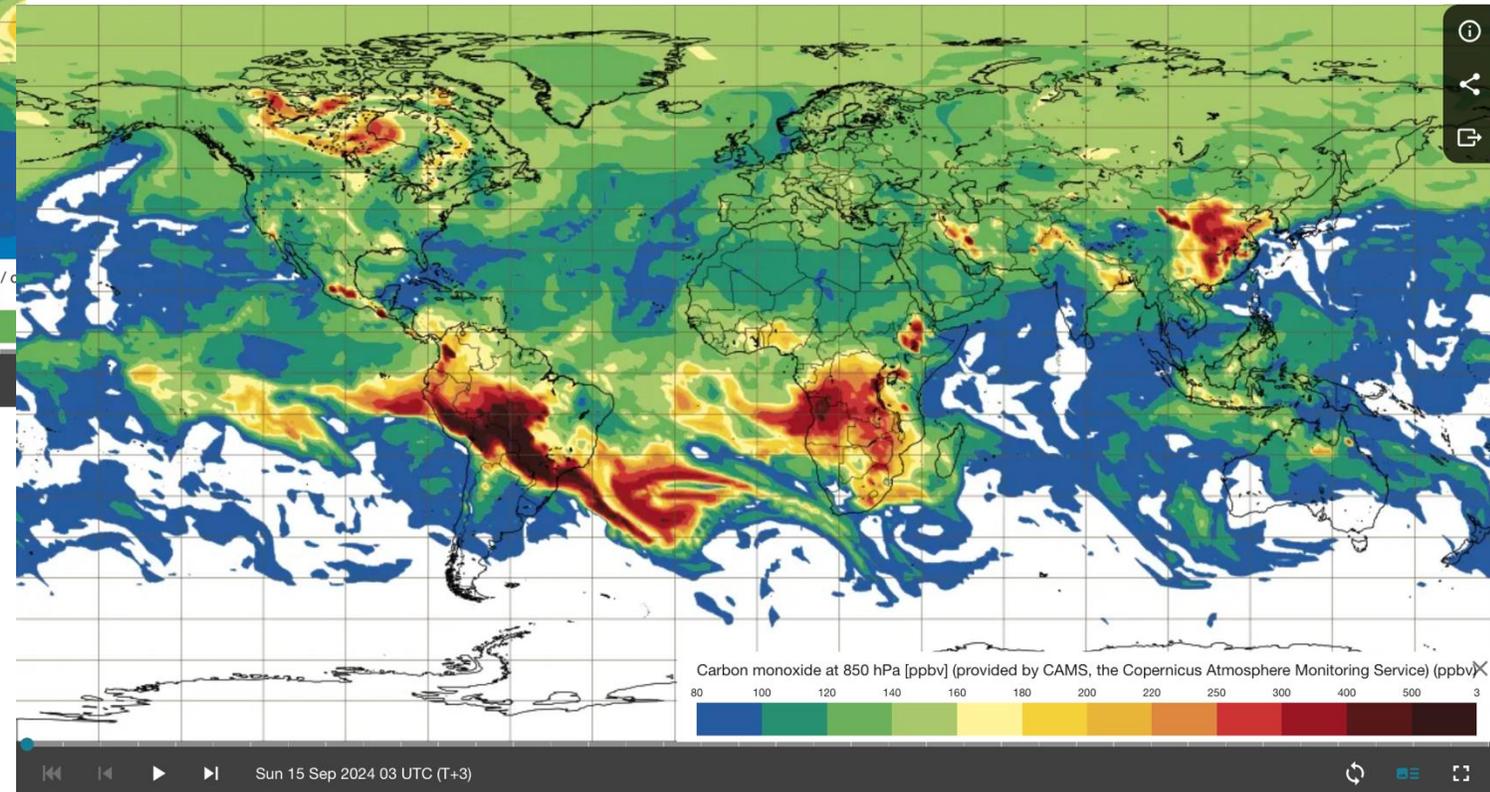

Total Column Carbon Monoxide forecast initialized 15 Sept 00 UTC

Carbon monoxide (CO) is a product of incomplete combustion and a good pollution tracer.

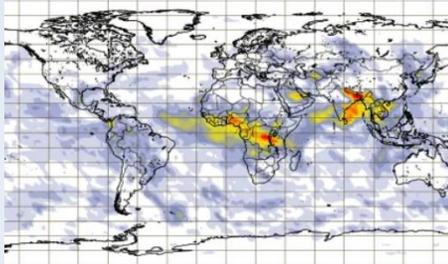

- Total column CO indicates most significant pollution sources (e.g., smoke from South America & tropical Africa).

Carbon Monoxide at 850 hPa forecast initialized 15 Sept 00 UTC

However, CO concentration at different levels of the atmosphere highlights additional regions:

- North America (wildfires)
- E Asia (anthropogenic pollution)

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
Lampedusa (35.52°N, 12.63°E).
1-31 Mar 2024, 00Z, T+3 to 24, VerOD 12.6.6.

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
Gozo (36.03°N, 14.26°E).
1-31 Mar 2024, 00Z, T+3 to 24, VerOD 12.6.6.

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
ATHENS_NTUA (37.98°N, 23.78°E).
1-31 Mar 2024, 00Z, T+3 to 24, VerOD 12.6.6.

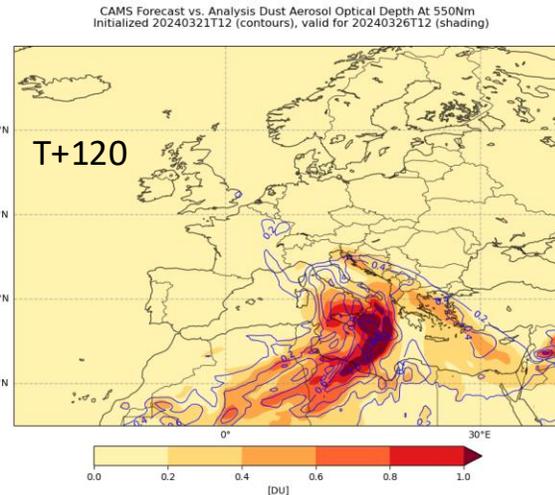

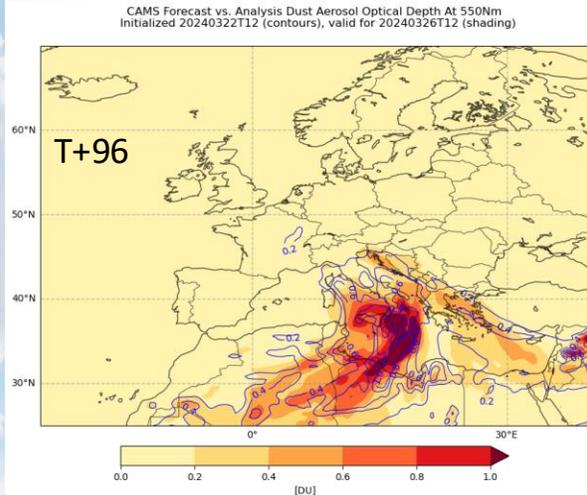

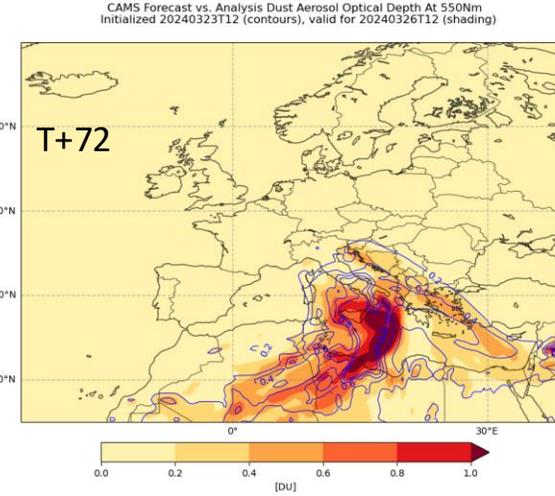

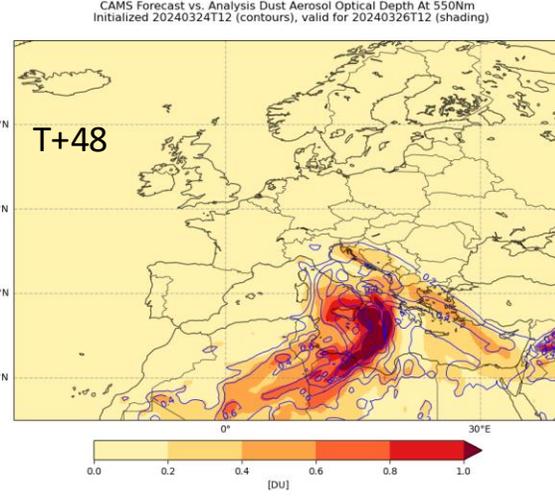

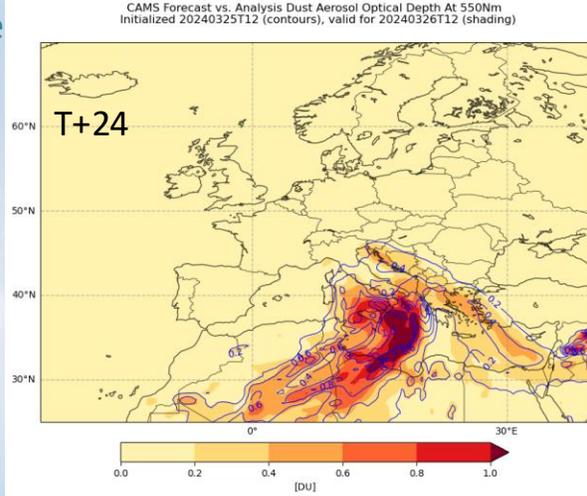

- Transport across S Europe/central Mediterranean with large AOD enhancements well represented in CAMS 24-h forecasts vs. Aeronet.

Saharan dust transport: 20 March

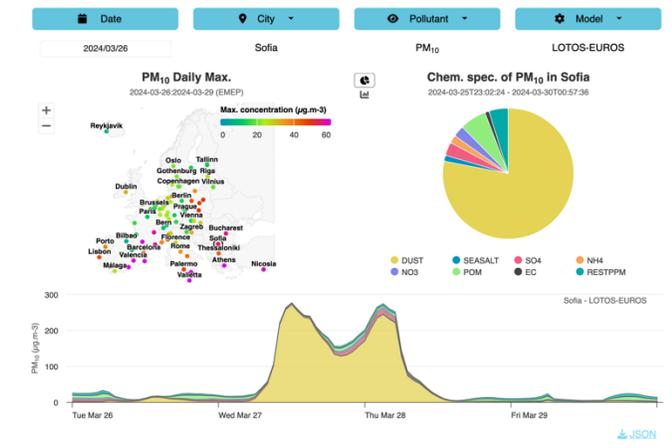

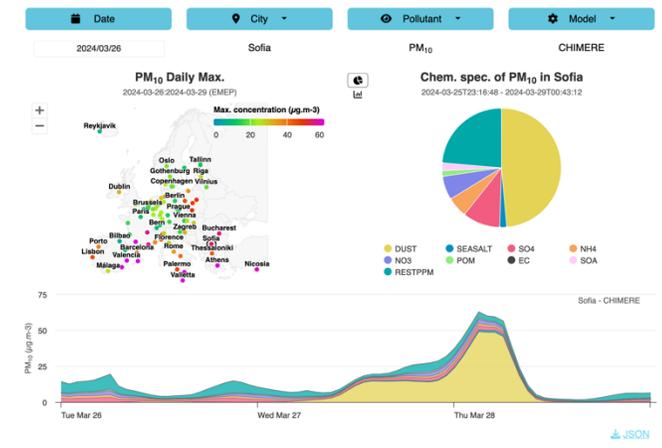

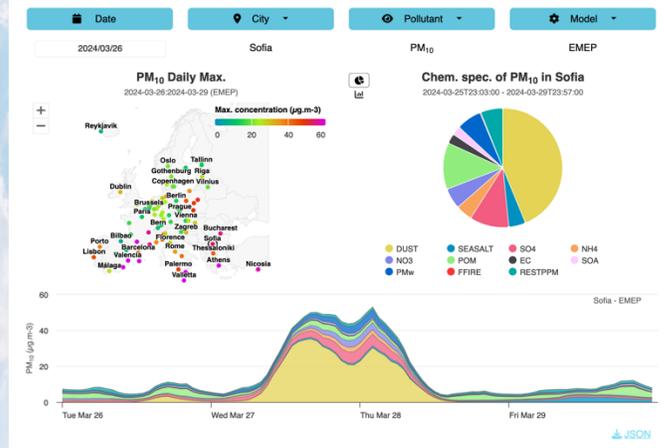

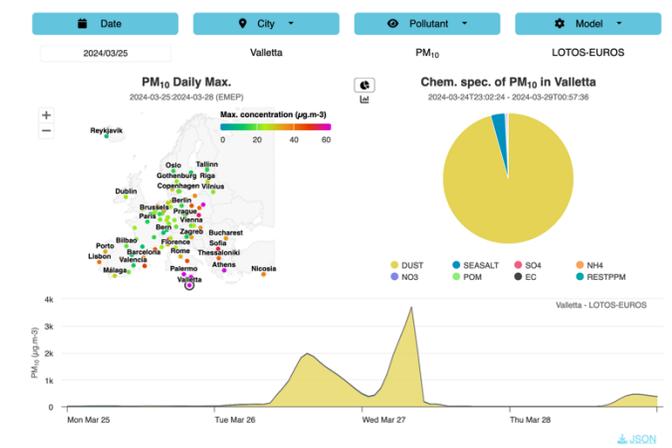

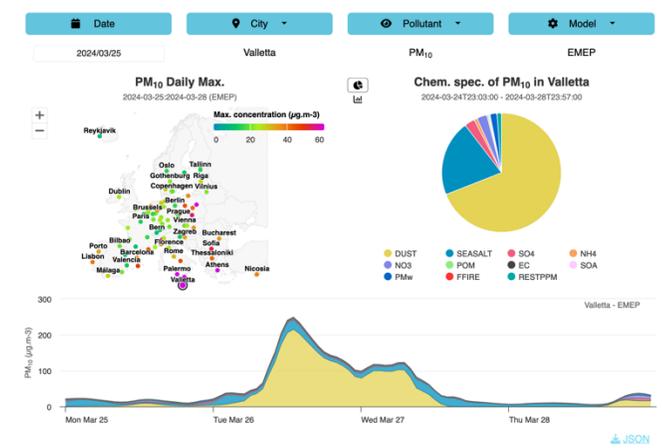

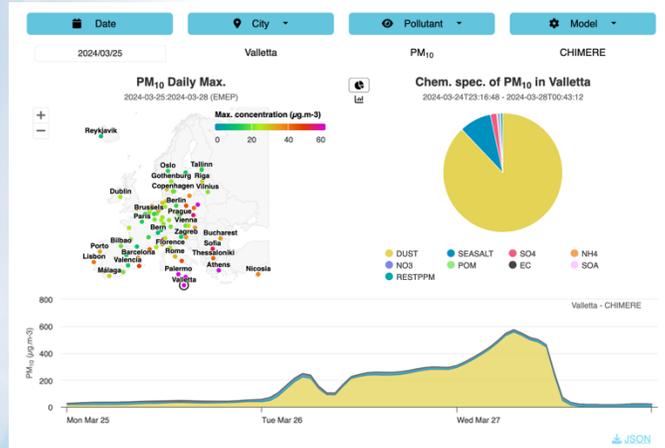

- Evaluation of CAMS o-suite forecasts vs. analysis over central Mediterranean.
- Shading shows analysis, blue contours show forecasts valid for 26 March 12 UTC.
- Distribution longer-range dust transport occurs up to T+120 but magnitude increases (and improves) as forecasts get closer to analysis time.

Saharan dust transport: 26 March

- Challenge in using CAMS policy support tools for evaluating PM₁₀ speciation with three CTMs.
- Some differences in relative contributions of dust vs. other sectors, and in timing of episodes.

Estimating Global Wildfire Emissions

Daily wildfires 1 January – 31 December 2024

CAMS emissions products:

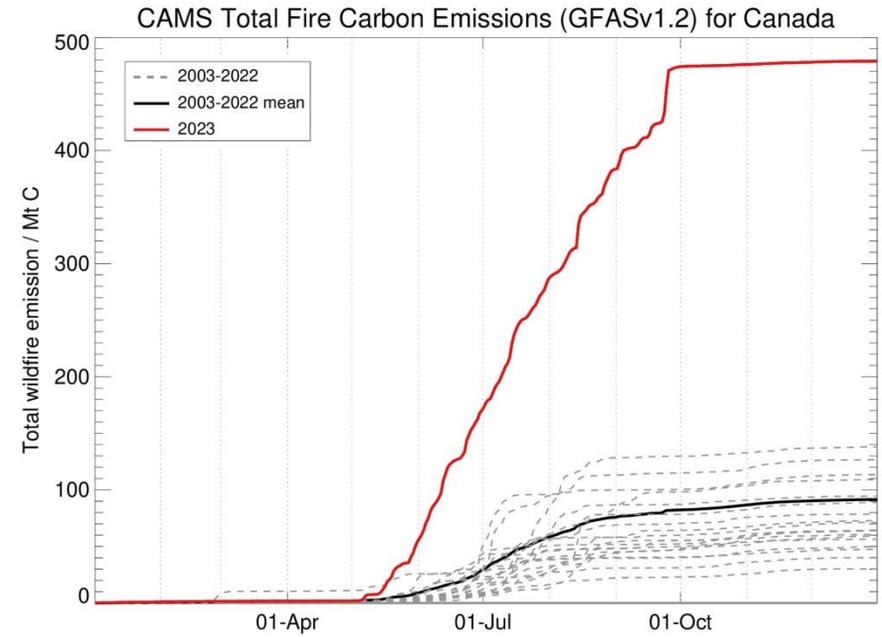

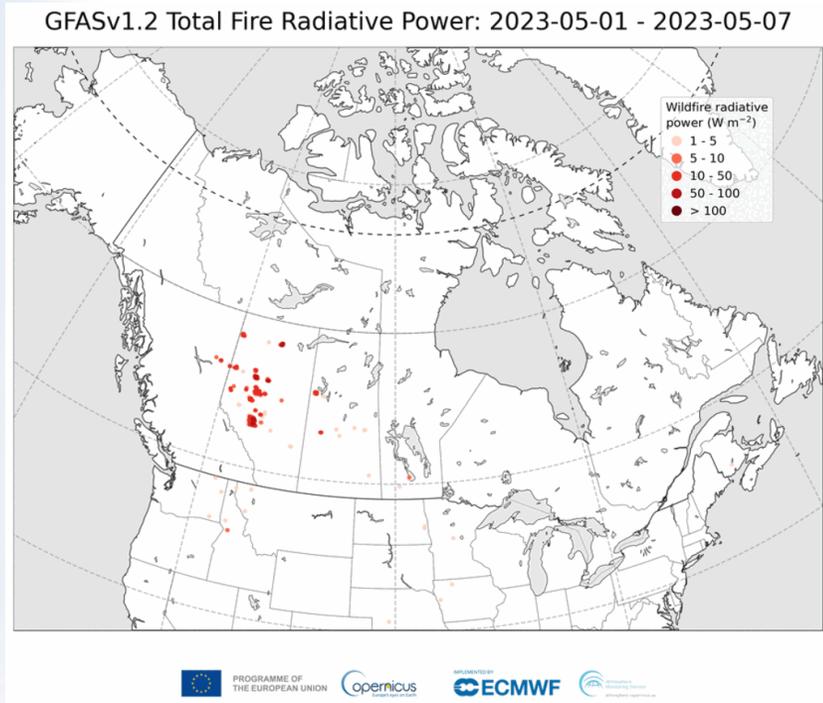

- Global anthropogenic emissions
 - 10 km x 10 km resolution; 2000-most recent year; based on nationally reported activity data
- Shipping emissions
 - 10 km x 10 km resolution; 2000-most recent year; based on AIS data
- Biogenic emissions inventory
 - 10 km x 10 km resolution; 2000-most recent year; based on MEGAN driven by ERA5 meteorology

- Global Fire Assimilation System (**GFAS**); see <https://ads.atmosphere.copernicus.eu/cdsapp#!/dataset/cams-global-fire-emissions-gfas?tab=overview>
- Uses satellite observations of Fire Radiative Power (FRP)
 - Currently Aqua and Terra MODIS FRP observations
 - FRP from VIIRS, Sentinel-3, and geostationary satellites are being tested for future implementation
- Global Coverage at ~10km Resolution
 - *Daily Output: 1-day behind NRT*
 - Hourly Output (+24-h means): 7-hours behind NRT
- Emissions of aerosols and gases are estimated using factors dependent on vegetation type.
- Injection heights calculated with Plume Rise Model and IS4FIRES

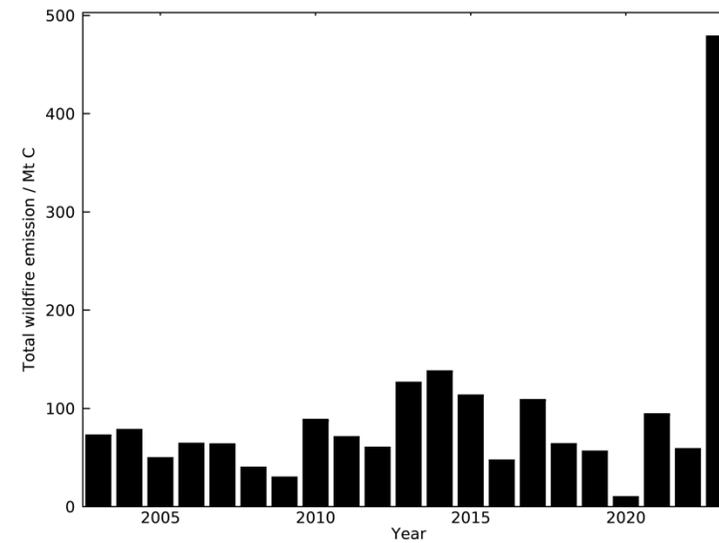

Canada wildfires 2023

- Canada experienced the highest number of fires, burnt area and emissions on record during 2023 with fires continuing from the beginning of May to the end of September.
- The majority of Canada's provinces experienced large-scale wildfires throughout the summer with Northwest Territories, Quebec, British Columbia and Alberta.
- Several reports and studies published in 2024.

CAMS GFASv1.2 Annual wildfire carbon emissions for Canada

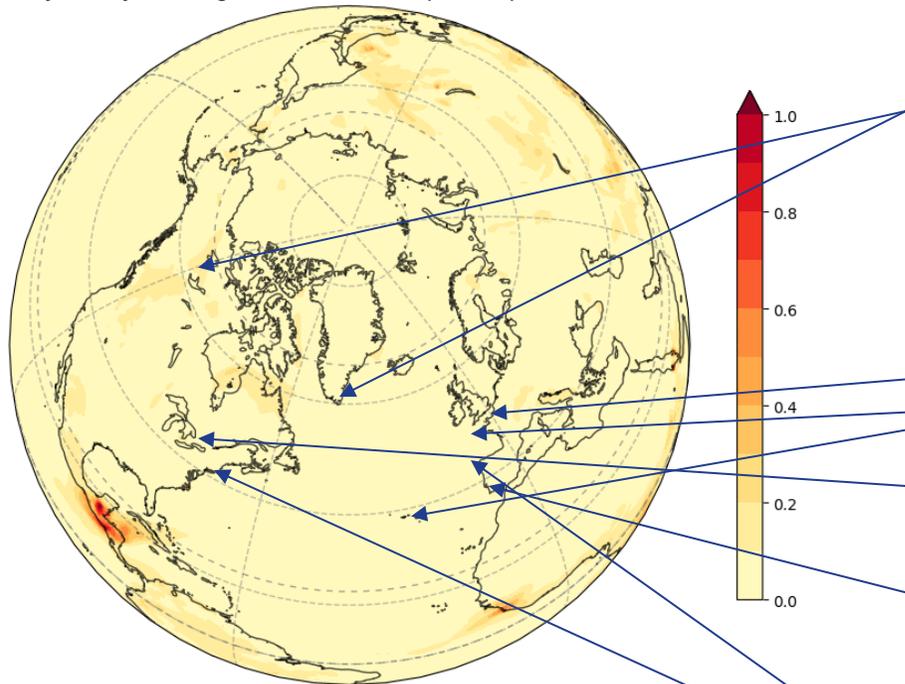

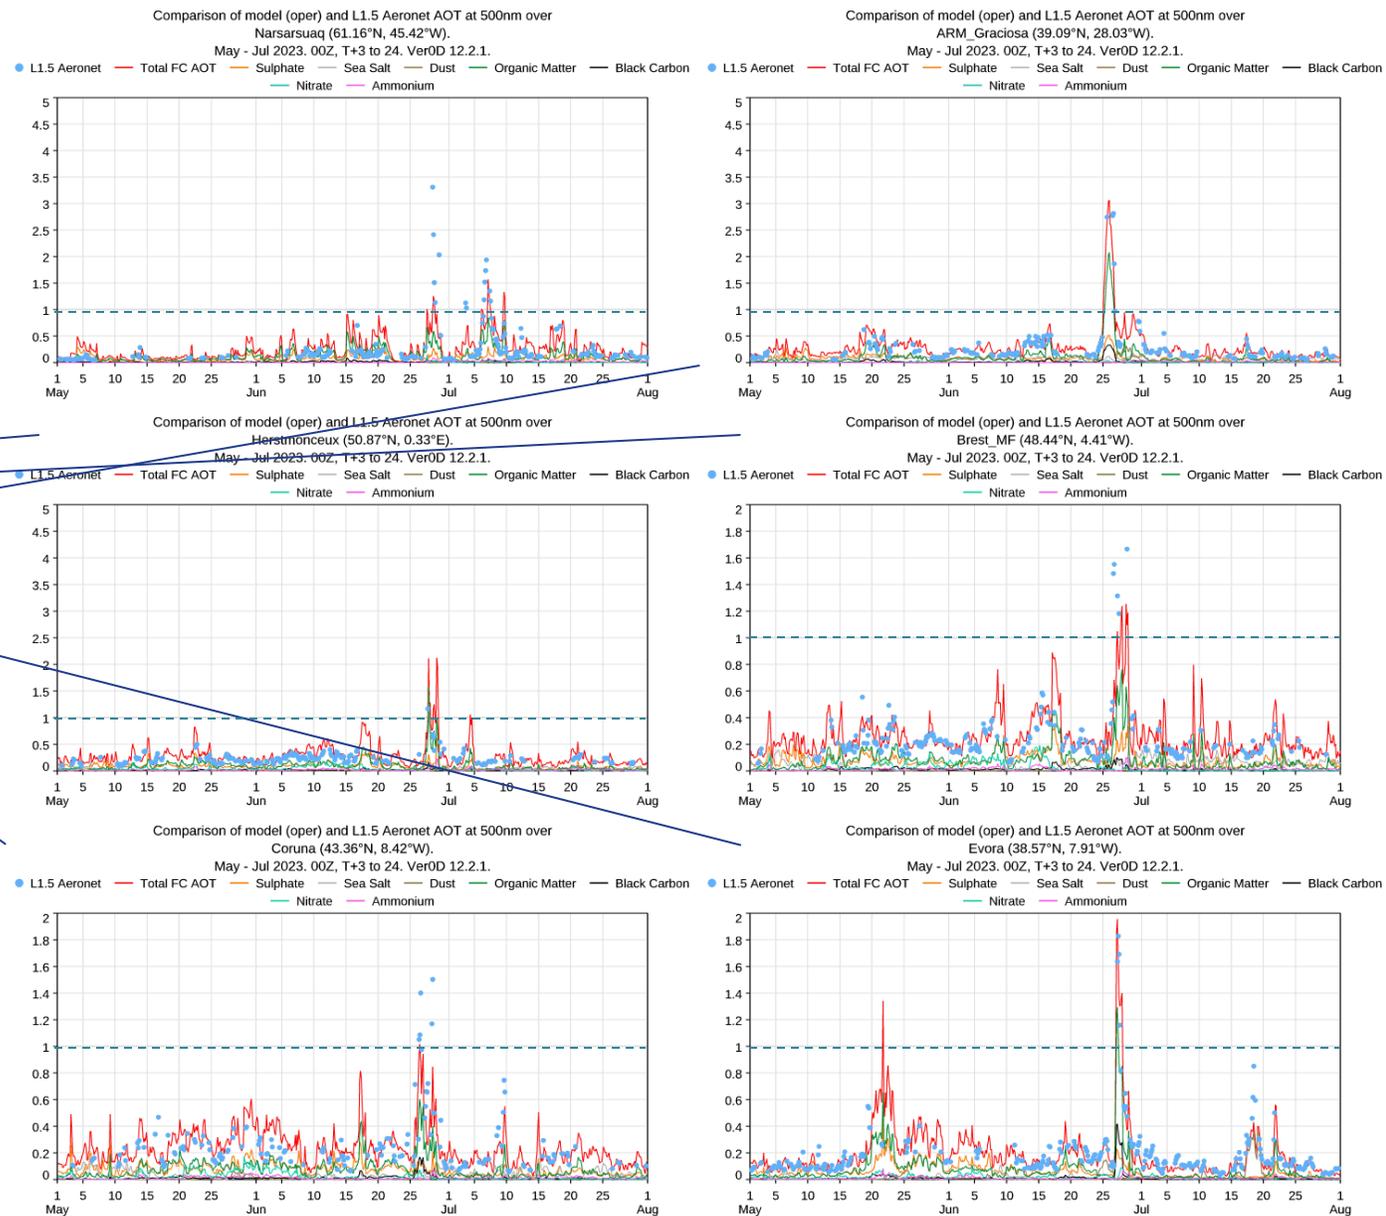

Atmospheric
Monitoring

Wildfire smoke transport between May and October

CAMS Analysis Daily Mean Organic Matter Aerosol Optical Depth at 550nm, 2023-05-01

PROGRAMME OF
THE EUROPEAN UNION

- Long-range transport of smoke from fires across Canada across North America and the North Atlantic throughout the summer.
- Good evaluation of CAMS Aerosol Optical Depth (AOD) against Aeronet under much of the smoke transport.
 - See example time series between May-October for Yellowknife, Toronto and Brookhaven.
 - Plus examples across the North Atlantic/W Europe at the end of June.

Global reanalysis of atmospheric composition (EAC4)

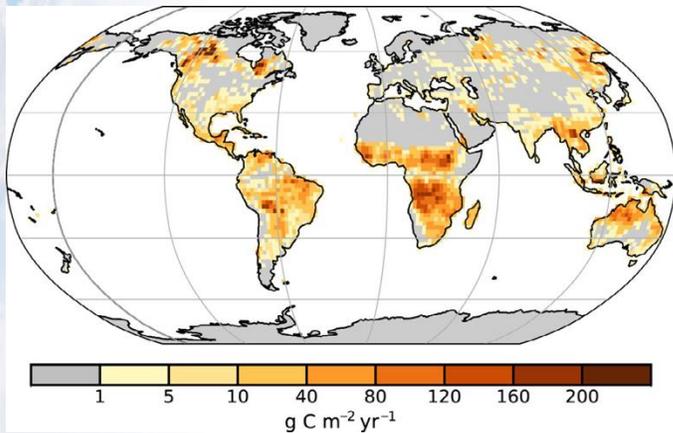

The atmosphere datastore now contains a full 21-year global re-analysis dataset for reactive gases and aerosol (EAC4).

<https://ads.atmosphere.copernicus.eu/datasets/cams-global-reanalysis-eac4?tab=overview>

The re-analysis takes stock of all available observation datasets using a fixed version of the CAMS forecast model. It is the BEST ESTIMATE of atmospheric composition patterns and evolution over the last two decades.

- 2024 is the second most extreme wildfire year for Canada after 2023 in terms of emissions.
- Western provinces/territories have all experience at least one month with highest emissions for that month in the summer.
- Significant long-range transport episode reached Europe resulting in measured surface PM2.5 and AOD enhancements.

CAMS Quality Assurance

[Home](#) / [Help & support](#) / [Quality assurance](#)

Quality Assurance

<https://atmosphere.copernicus.eu/quality-assurance>

An important element of the CAMS services is the Evaluation and Quality Assurance (EQA) of the products. Not only does CAMS produce many data sets for its users, it also provides information about how accurate these products are. Users can therefore make better use of the data sets by taking the uncertainty into account.

Global Services

The global analyses and forecasts are evaluated every three months. CAMS uses a multitude of independent observational data sets to verify these products. In addition, the global reanalysis and test runs for all system upgrades are carefully assessed in a similar way to provide clear indications of the quality of these products.

Supplementary services

The solar radiation products (irradiance and UV) are evaluated every three months and the annual greenhouse gas flux estimates are being evaluated with each release of a new data set. CAMS uses a multitude of independent observational data sets to verify these products.

Regional services

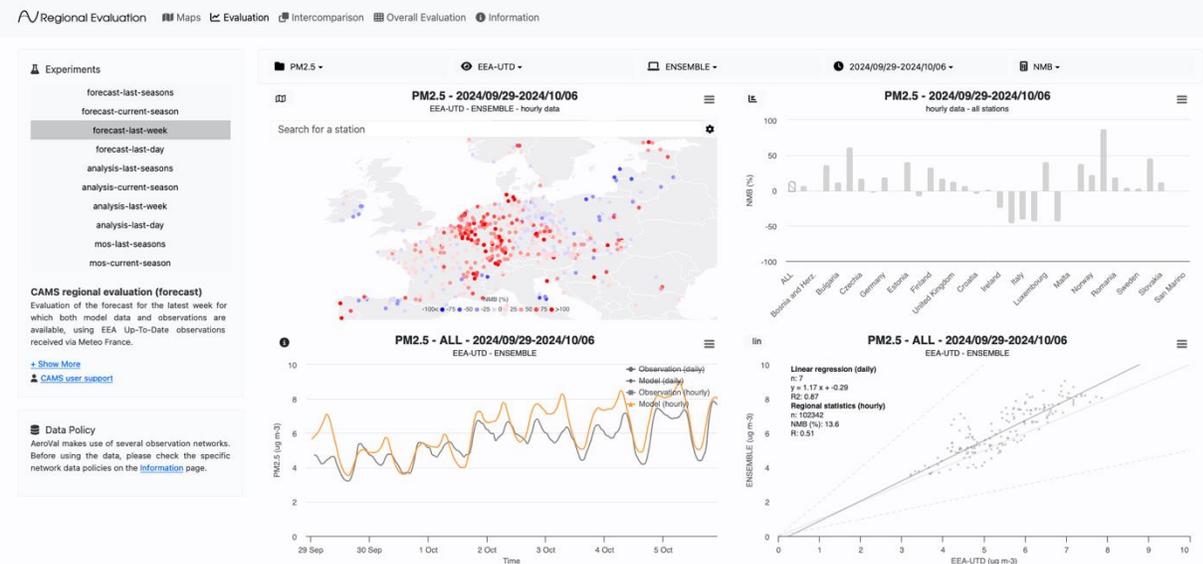

The regional analyses and forecasts are evaluated on a 3-monthly basis. CAMS uses a multitude of independent observational data sets to verify these products. The reports include a report for each modelling system as well as for the ensemble of the models. Validation is focused on surface concentrations but a separate report is generated to assess above-surface values as well as the interface between the global and regional systems.

- Validation is central to CAMS operations.
- Quarterly validation reports.
- Global and regional evaluation servers.

<https://global-eqc-server.atmosphere.copernicus.eu/pages/evaluation/?project=cams2-82&experiment=IFS>

Understanding the New Era of Fire

Wildfires, driven by climate change, have become more intense and frequent, but scientists are still trying to understand larger patterns.

Share full article

The Copernicus Atmosphere Monitoring Service, a research organization funded by the European Union, reported this month that fires in Canada were **above average in some regions**, and about 25,000 people had to be evacuated from their homes when Jasper National Park in Alberta was burned by the biggest blazes it's **experienced in a century**.

Large-scale and intense wildfires carrying smoke across northern hemisphere

Late spring and early summer blazes in Canada, Alaska and eastern Russia add to carbon emissions

A wildfire near Ashcroft, British Columbia, on 20 July. The province had total of 11.1 megatonnes across June and July, which were increased by fires. Photo: Winter/Reuters

The northern hemisphere has had a large number of intense wildfires in the first half of summer, carrying vast amounts of smoke across Eurasia and North America.
