Luigi Catani, In the presence of the Grand Duke, Galileo performs the experiment of the falling bodies from the Tower of Pisa

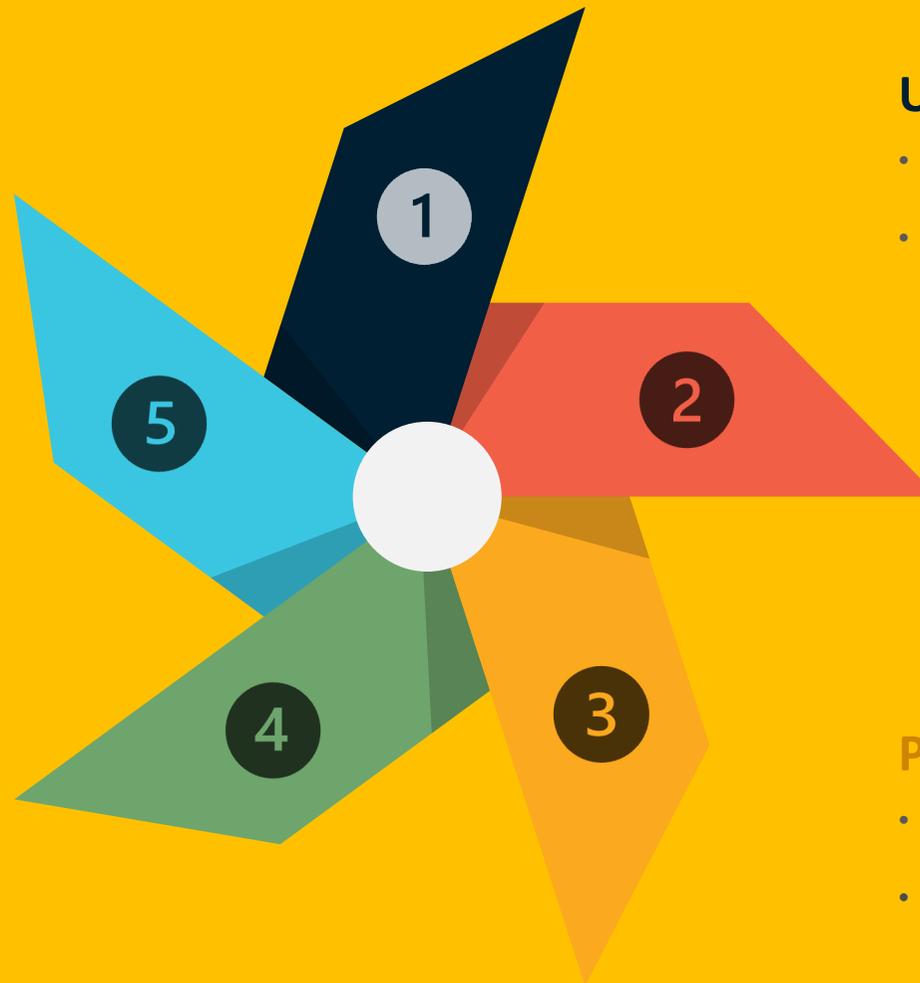

Our programme in this training

Advocacy plan

- Promoting science as input to policy. An exercise

Future visions

- Shaping tomorrow: science in an uncertain world
- The power of connection

Understanding science

- Scientific principles of climate change
- The air we breathe: understanding air quality

Policy framework AQ

- A historical perspective and recent developments
- Modern scientific tools for policy support

Policy responses to CC

- From history to present
- Scientific methods to provide information to policy

Outline

- Scientific principles of climate change
- The air we breathe: understanding air quality

❁ What is a recent news article or fact about climate change that caught your attention?

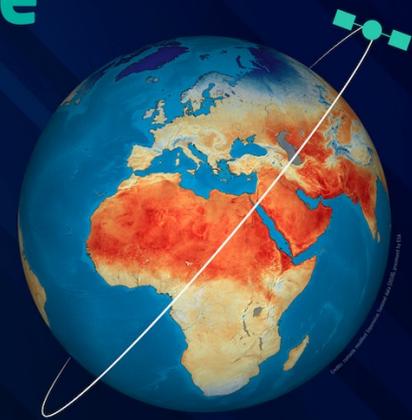

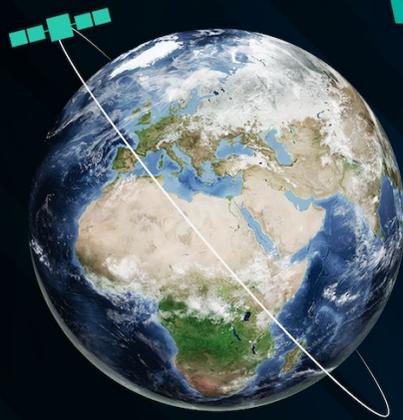

What is climate?

It is the long-term average of conditions of the atmosphere, oceans, and glaciers together, typically described over long-time intervals such as months, seasons, years, decades

Weather versus Climate

The difference between weather and climate is a matter of time

Weather

refers to short-term changes in the atmosphere. It can change minute-to-minute, hour-to-hour and day-to-day

Climate

describes the average weather conditions in a specific area over a long period of time – 30 years or more

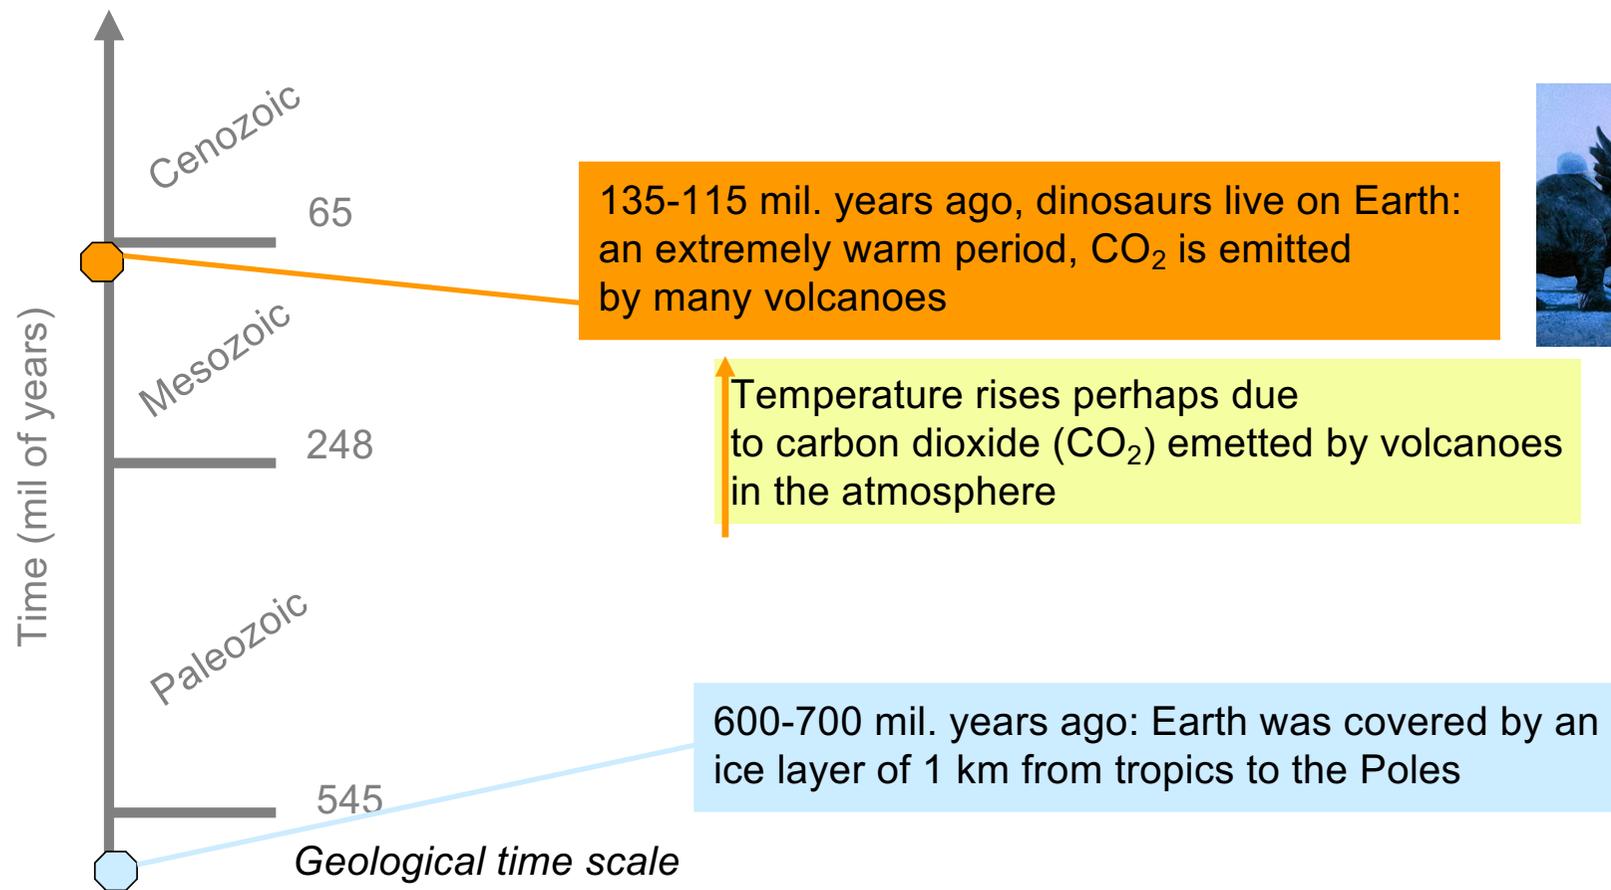

Satellites measure several aspects of Earth's weather as well as provide essential data over decades to monitor how our climate is changing

Climate is influenced by

Climate has always changed

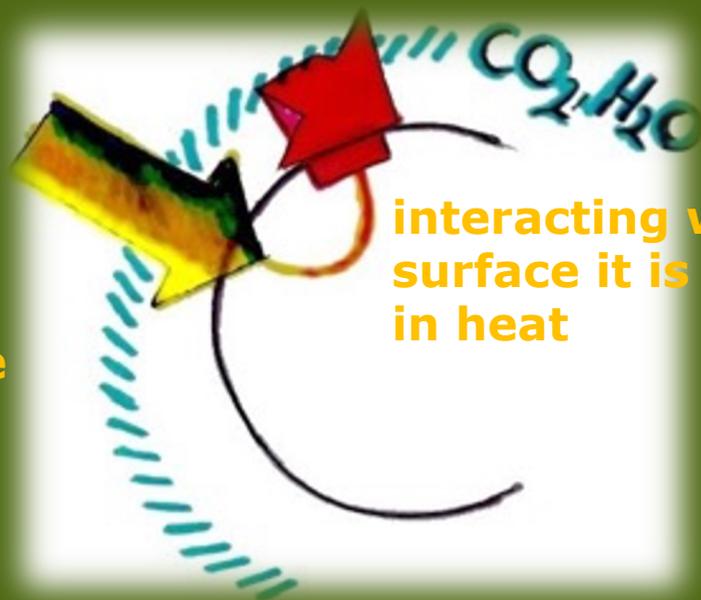

The Greenhouse effect

The visible solar radiation arrives

is absorbed by some of the gases and reemitted

passes through the atmosphere

interacting with the surface it is transformed in heat

warming the Earth

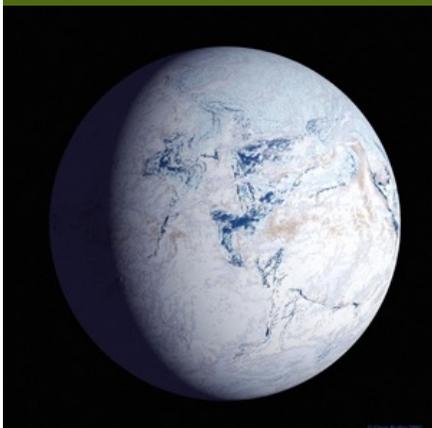

The greenhouse gas effect is natural

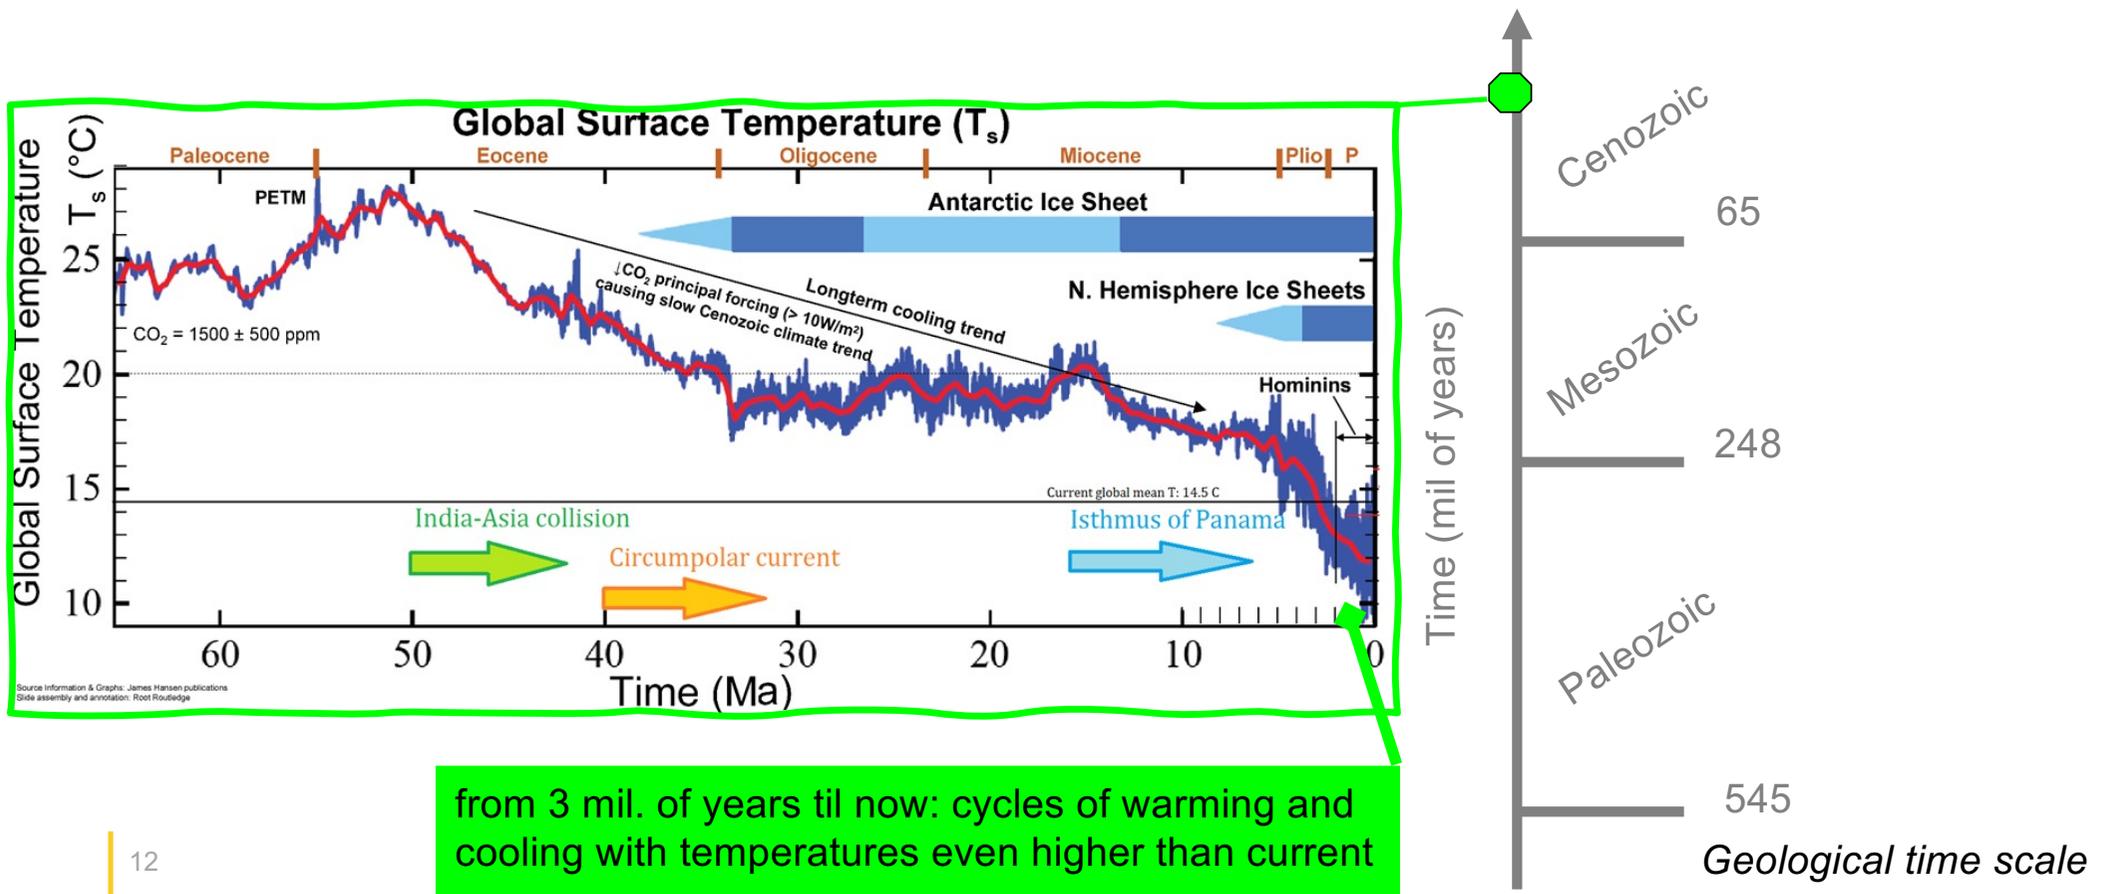

Since the beginning of the Earth its atmosphere contained **CO₂** due to volcanic activity

The existence of the atmosphere and of the natural greenhouse effect determined the origin of life

Without greenhouse gases, the global temperature would be around **18 degree below zero**

Climate has always changed

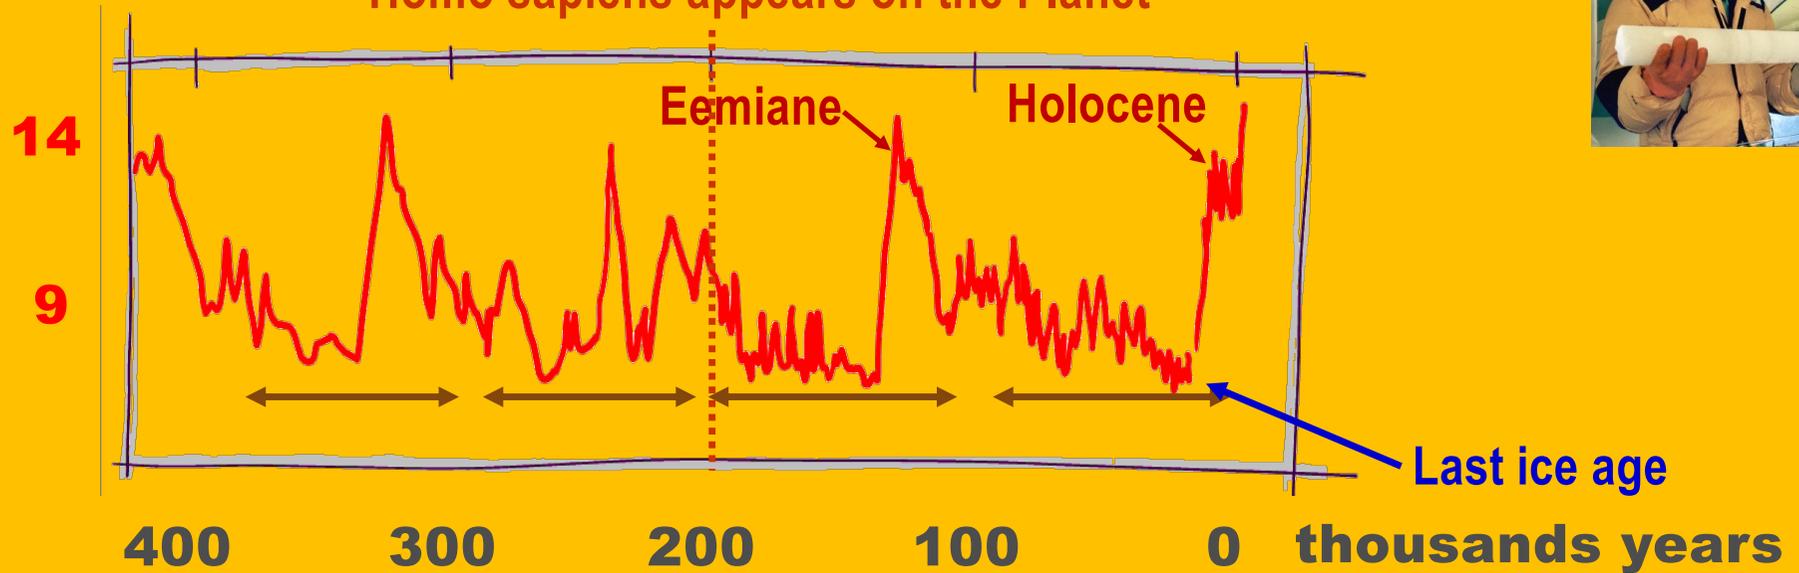

Temperature of last 450.000 years

In a more recent time...

Average temperature of the Earth (°C)

Homo sapiens appears on the Planet

100.000 year cycles – Earth's orbital cycles

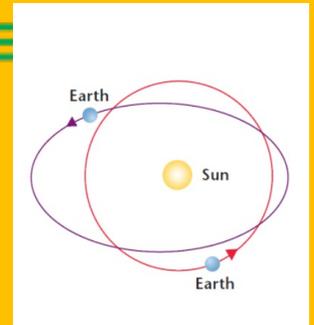

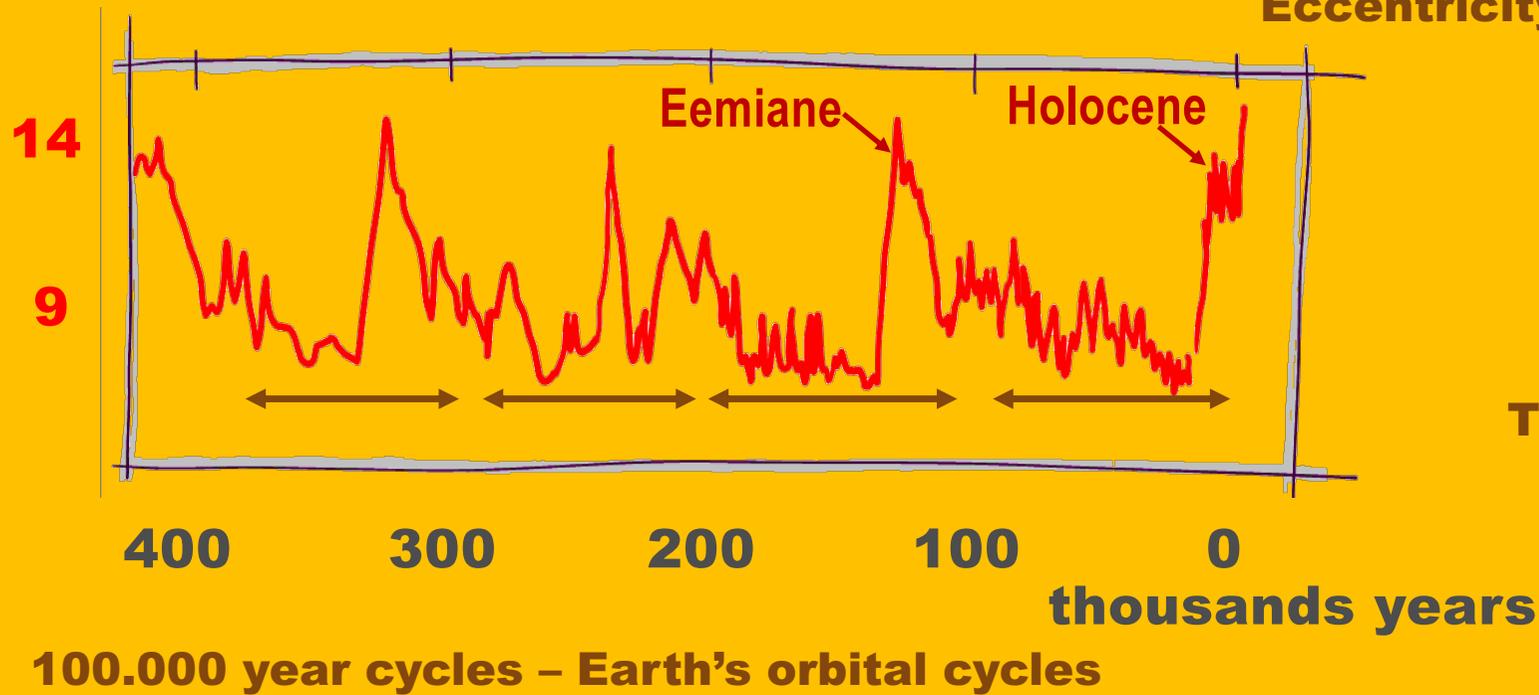

Petit et al, 1999

Temperature of last 450.000 years

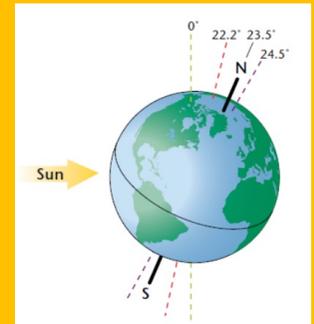

In a more recent time...

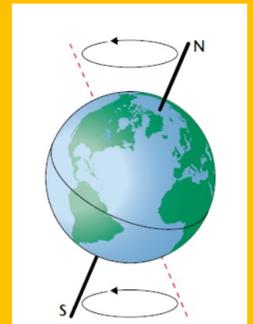

Average temperature of the Earth (°C)

Eccentricity (100.000 years)

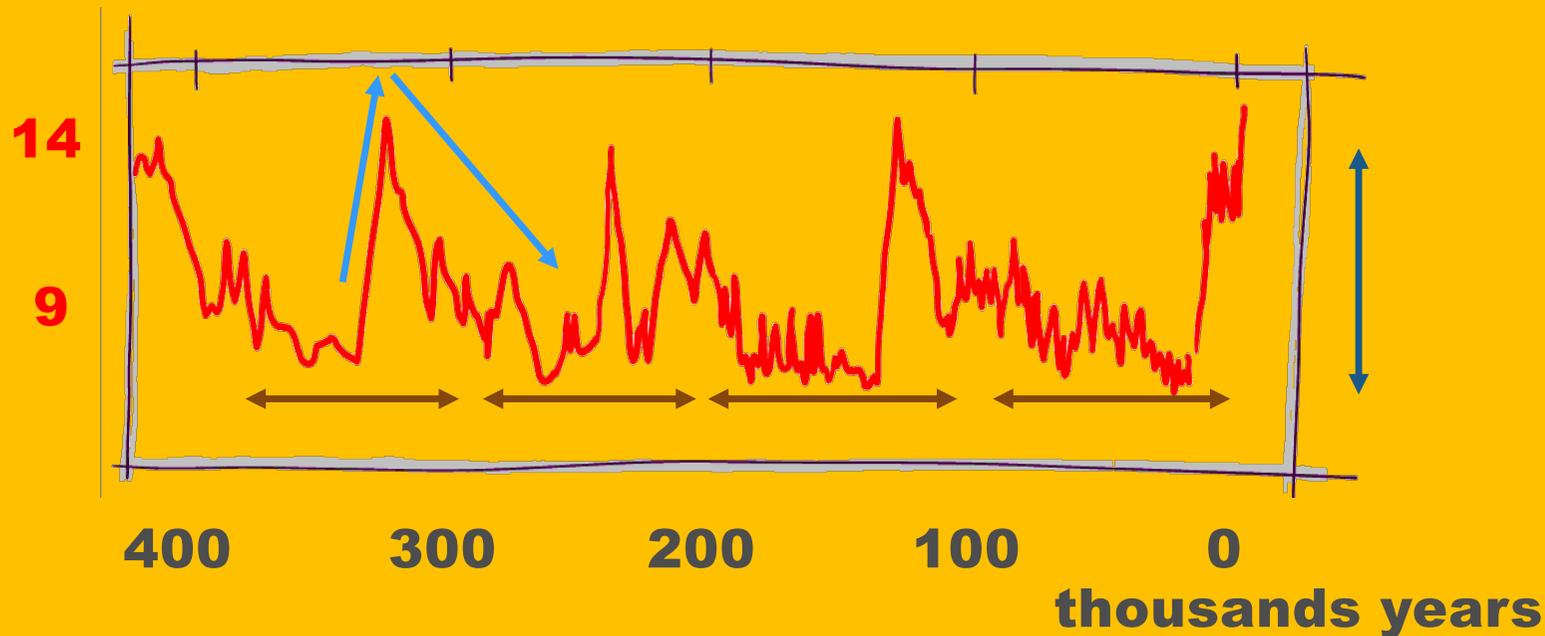

Tilt (41.000 years)

Precession (21.000 years)

In a more recent time...

Average temperature of the Earth (°C)

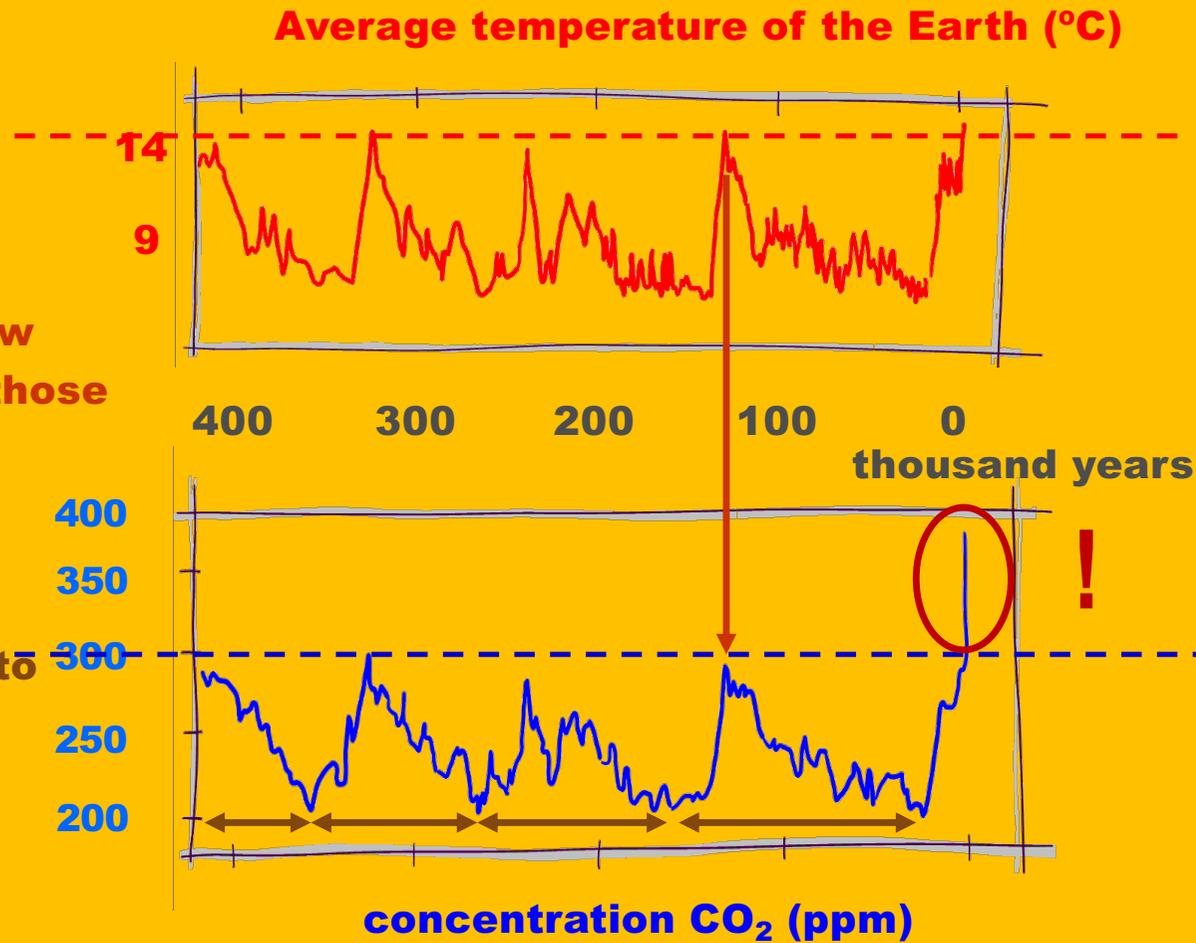

100.000 year cycles – Earth's orbital cycles

Warmings more rapid than coolings

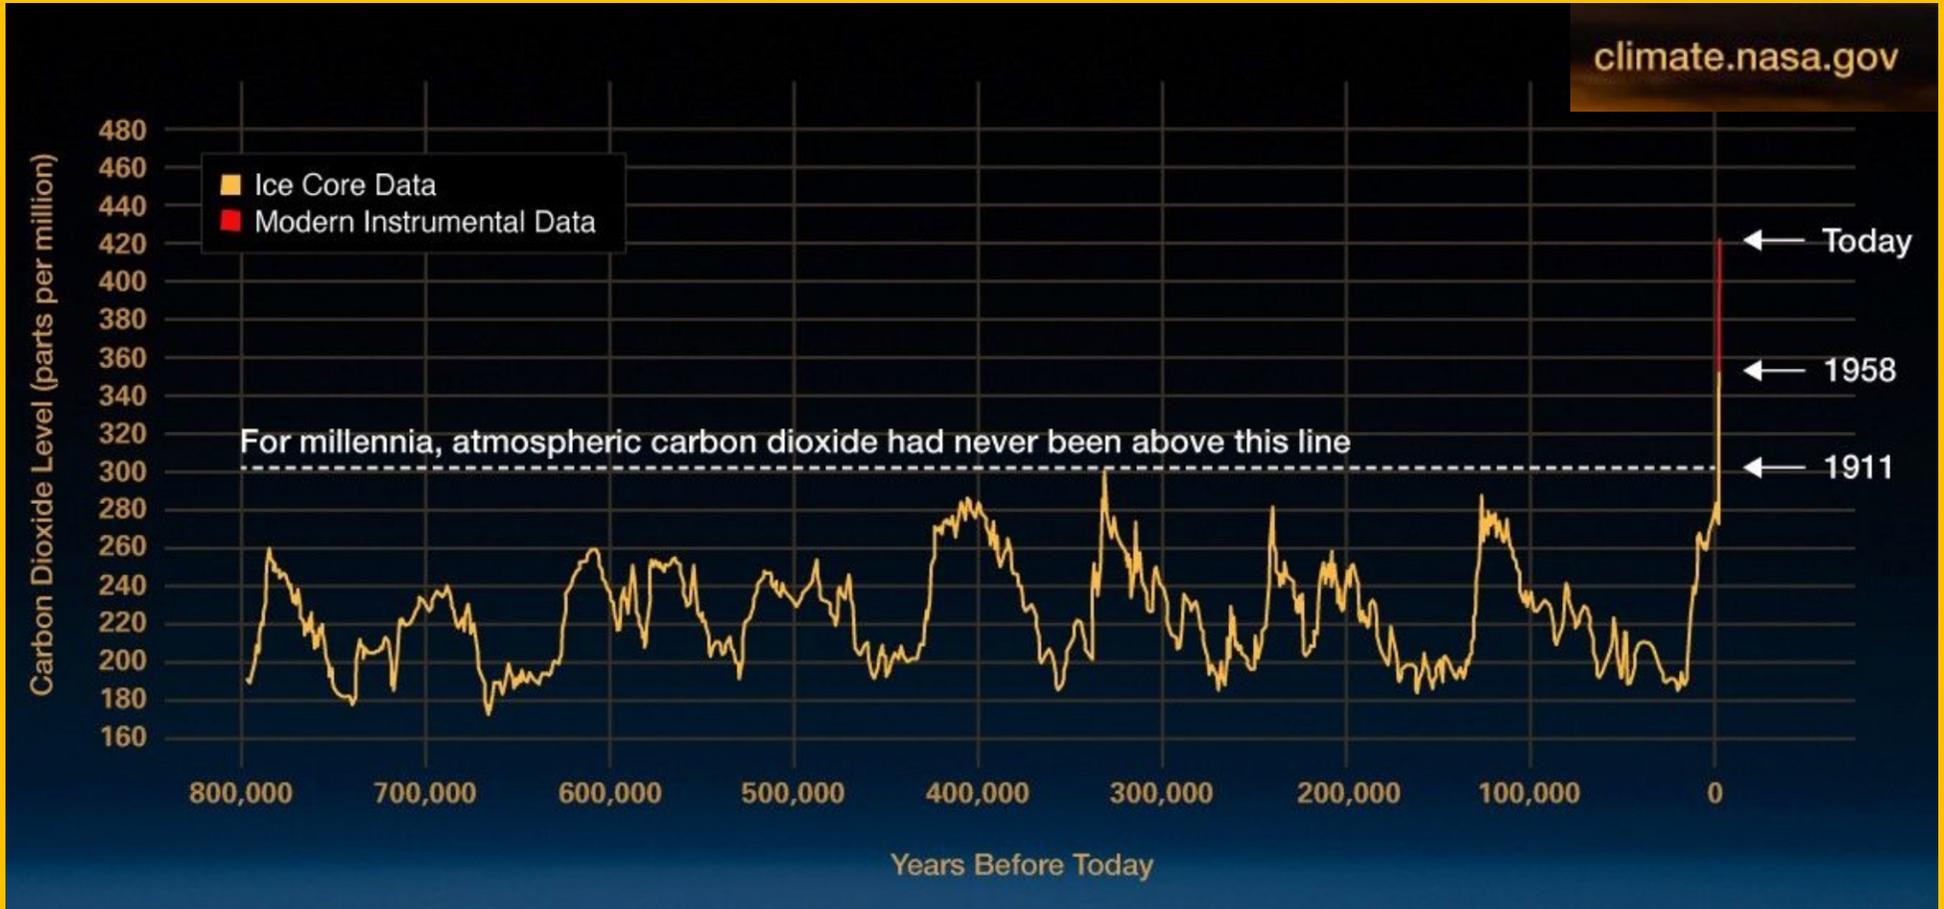

5 degree °C between ice and interglacial ages (in roughly 20.000 years)

T variations precede by a few hundred years those of CO₂

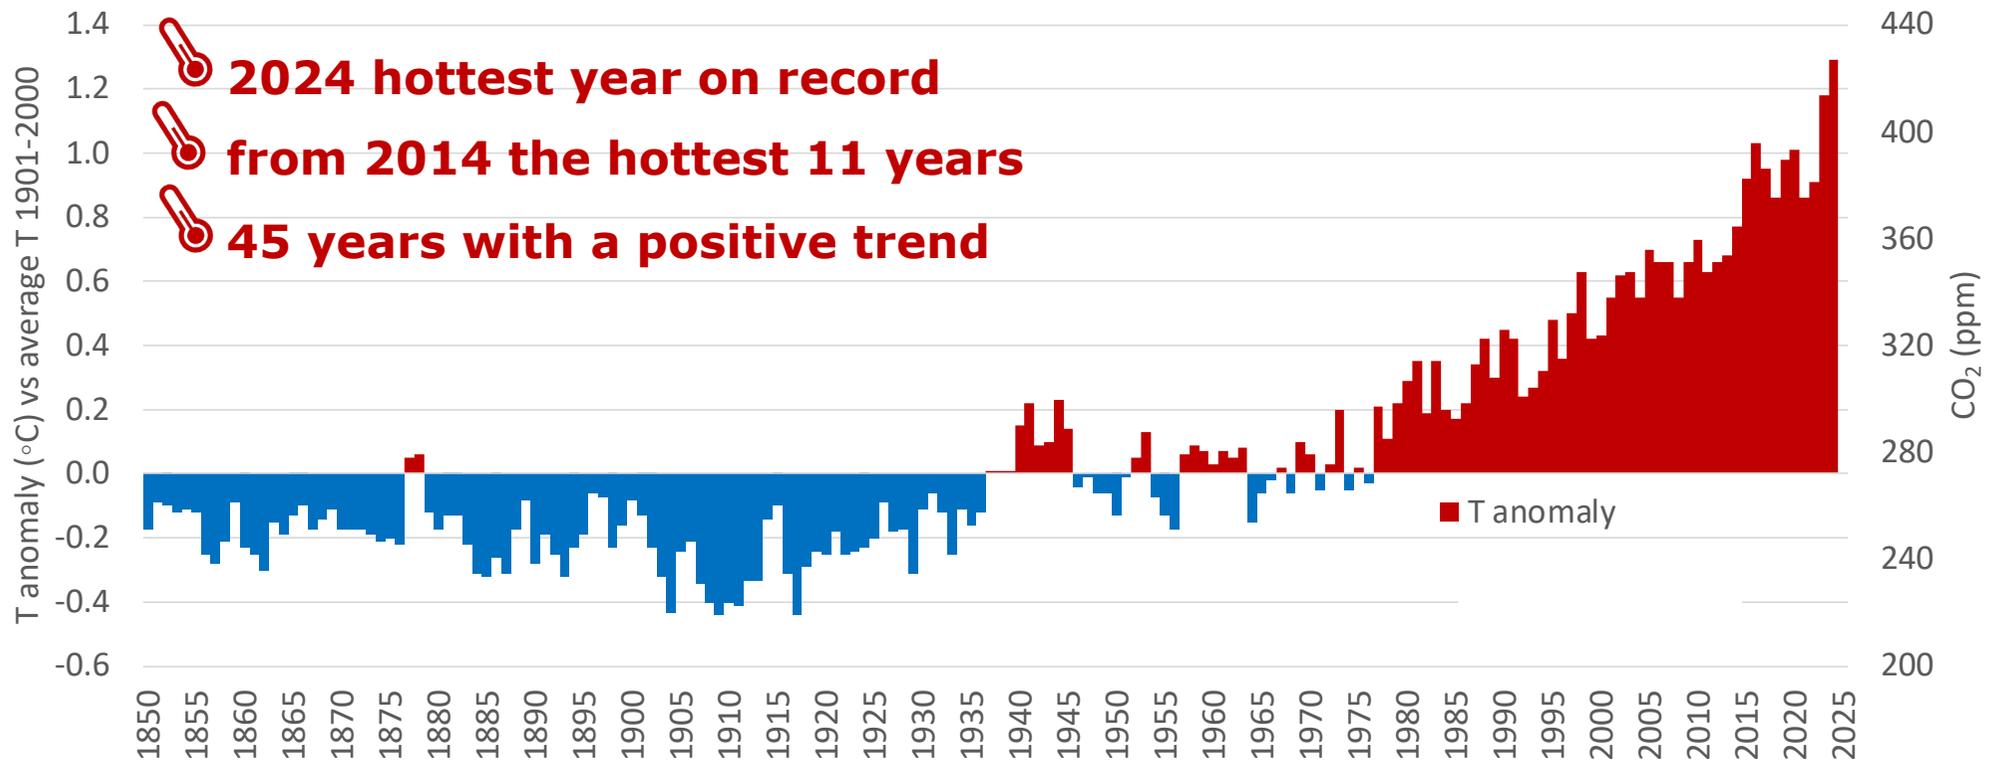

Similar cycles to temperature

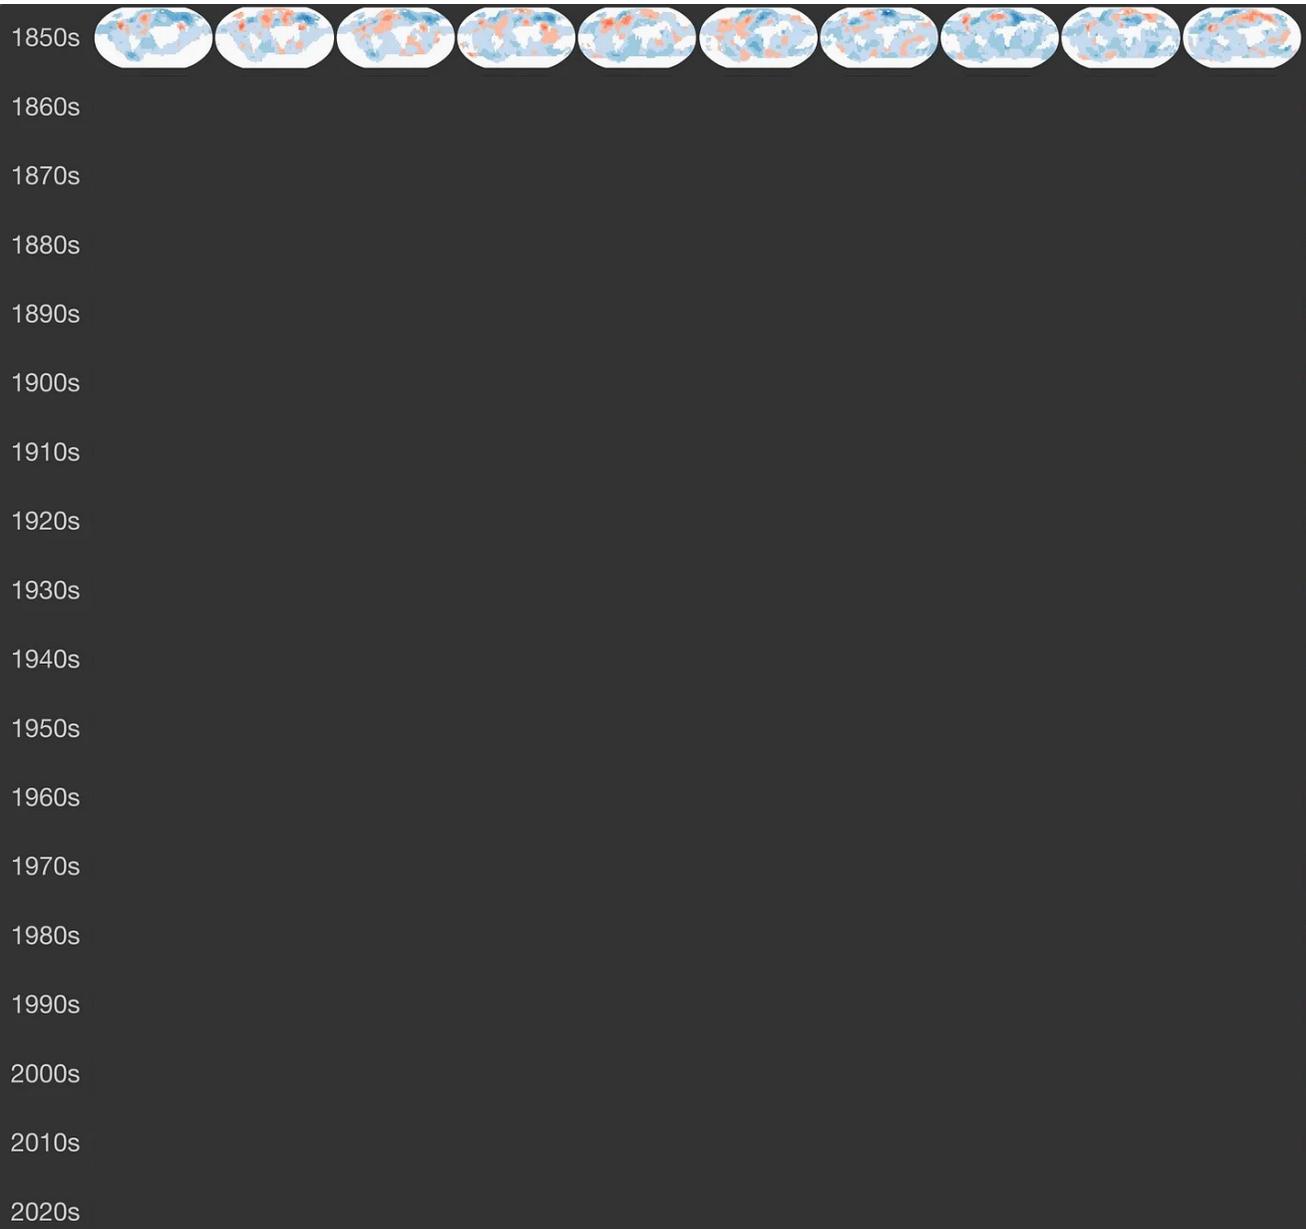

CO₂ rate of change is unprecedented over millenia

Change of temperature

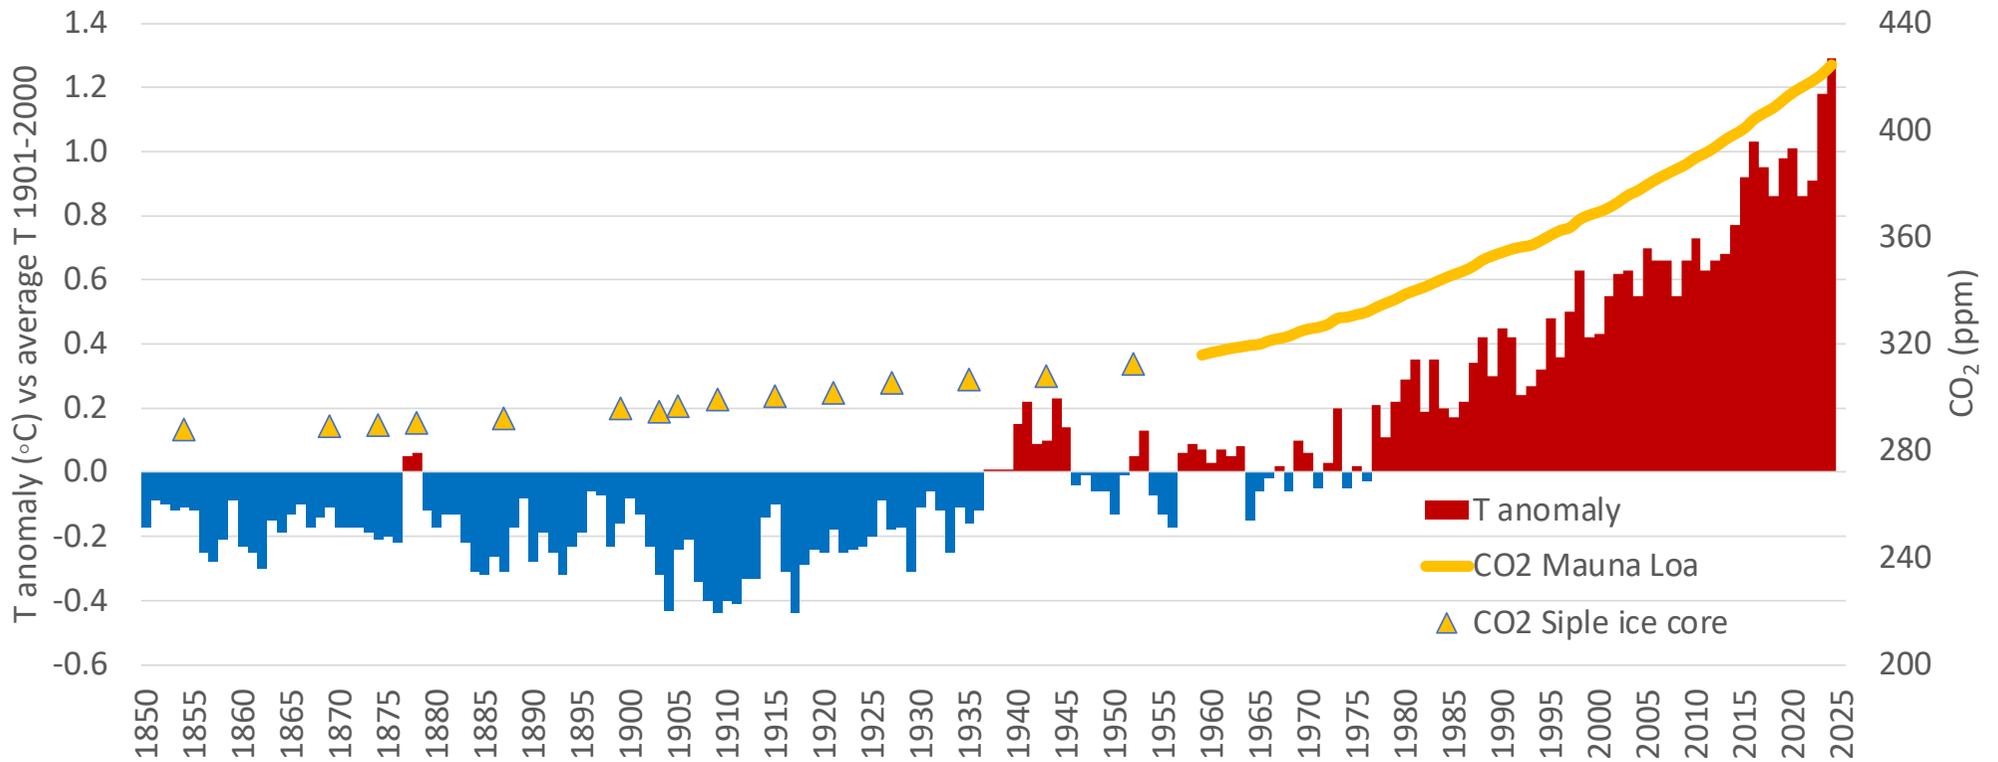

Mapping changes in temperature
from 1850 to 2024

One for each year,
showing cooler
(blue) and warmer
(red) regions.

The warming of
the planet is
obvious
everywhere

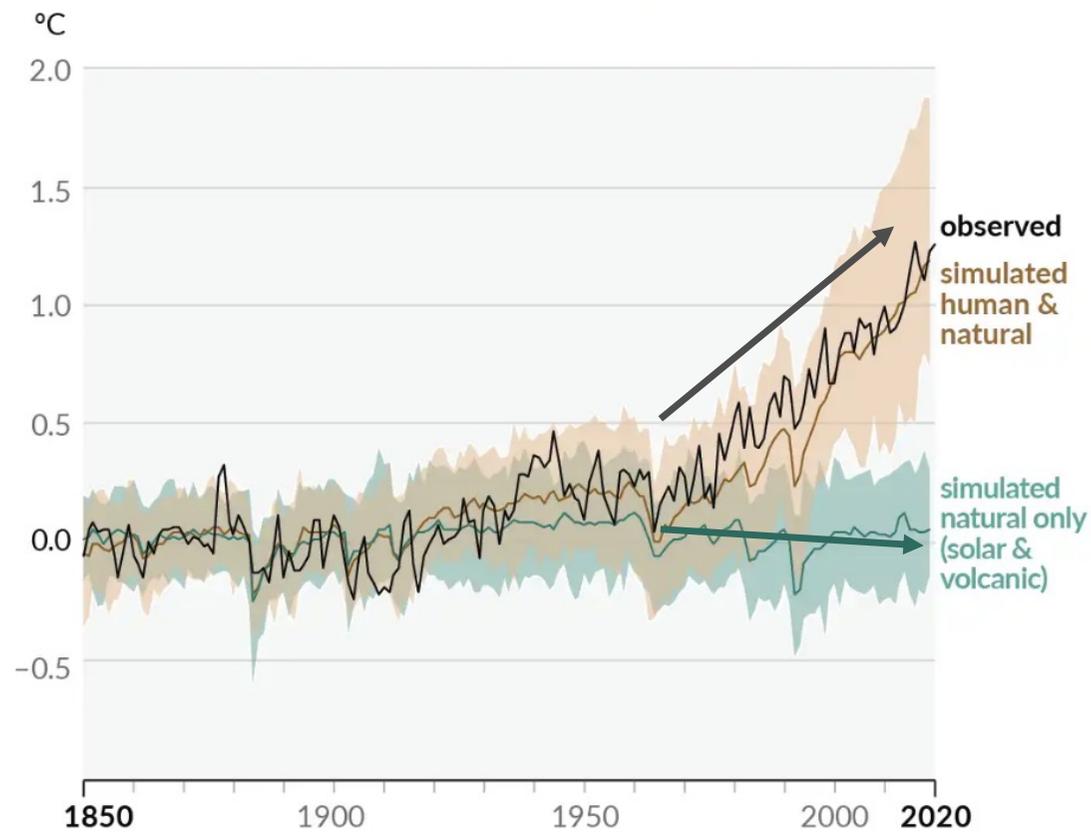

Change of greenhouse gases

1.46 degree °C in roughly 170 years

T increase coinciding with increase of CO₂

How do we know humans are the cause?

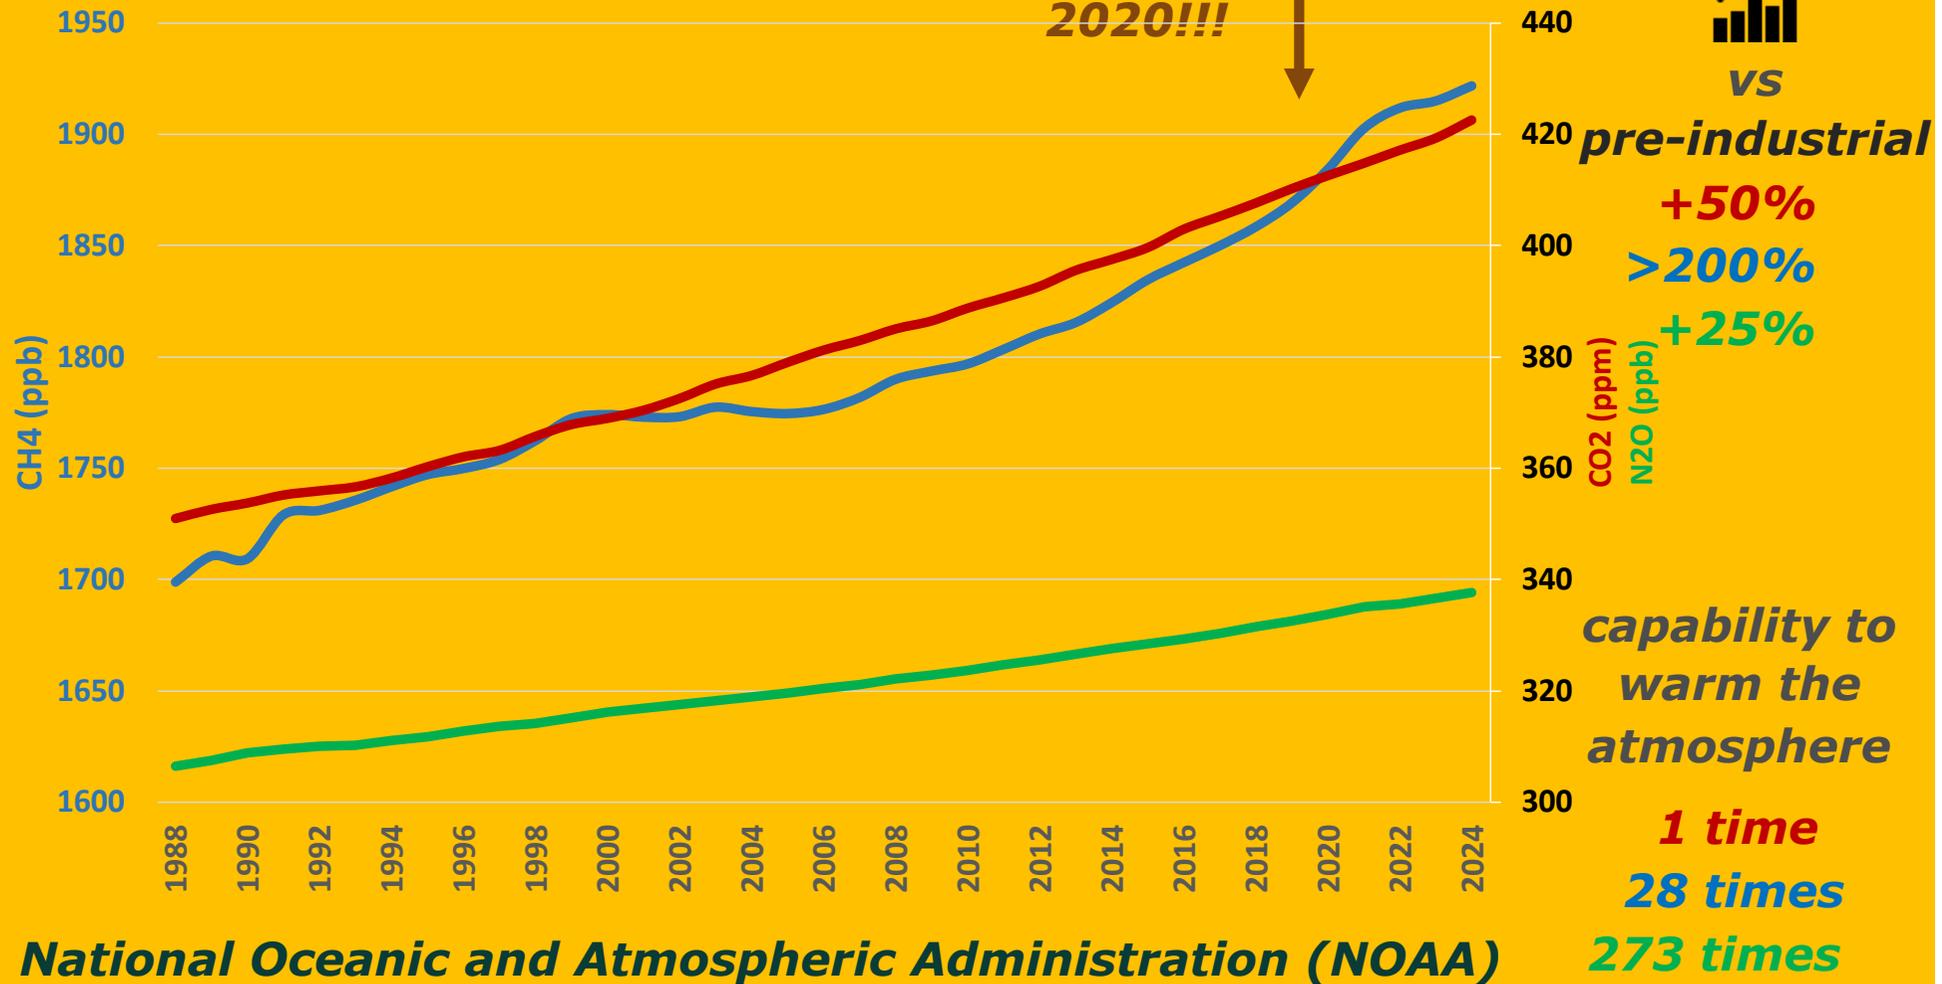

IPCC, Climate Change 2021: The Physical Science Basis, 2021

Major greenhouse gases

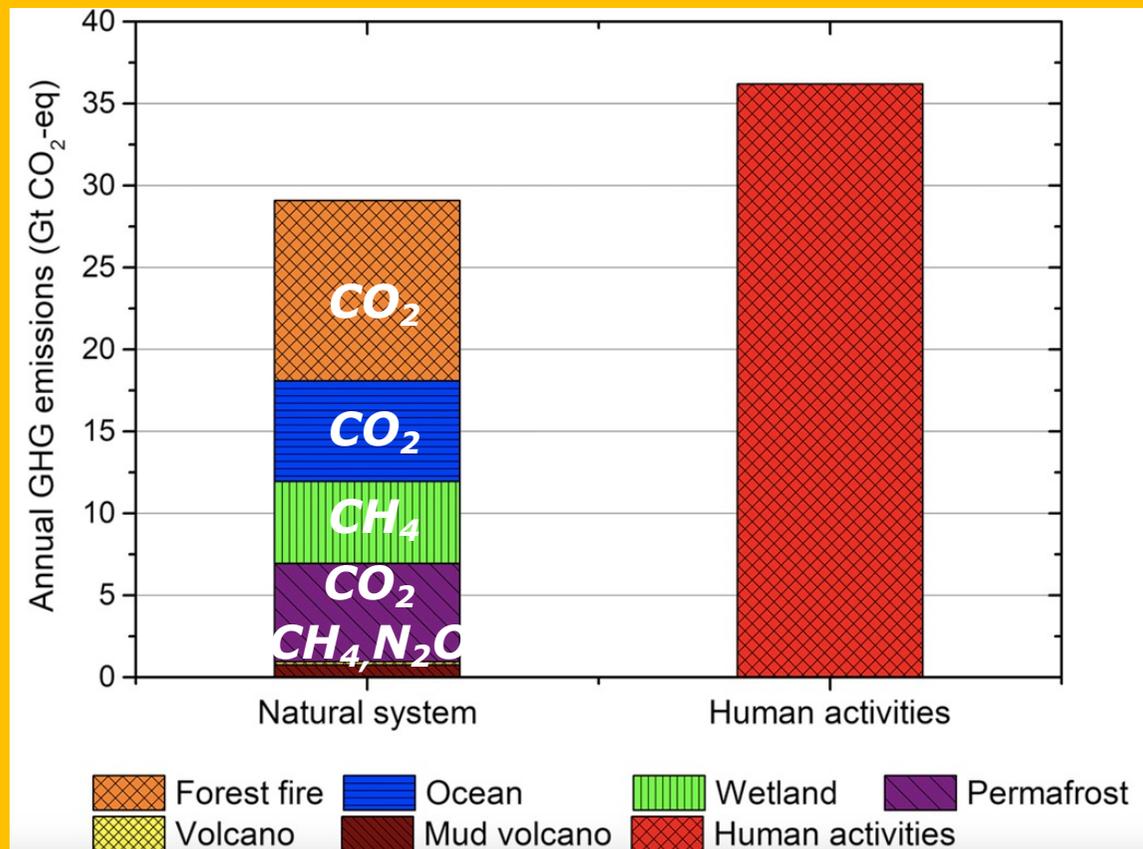

GHG concentrations

Greenhouse gasses from human activities

Yue and Gao, 2018

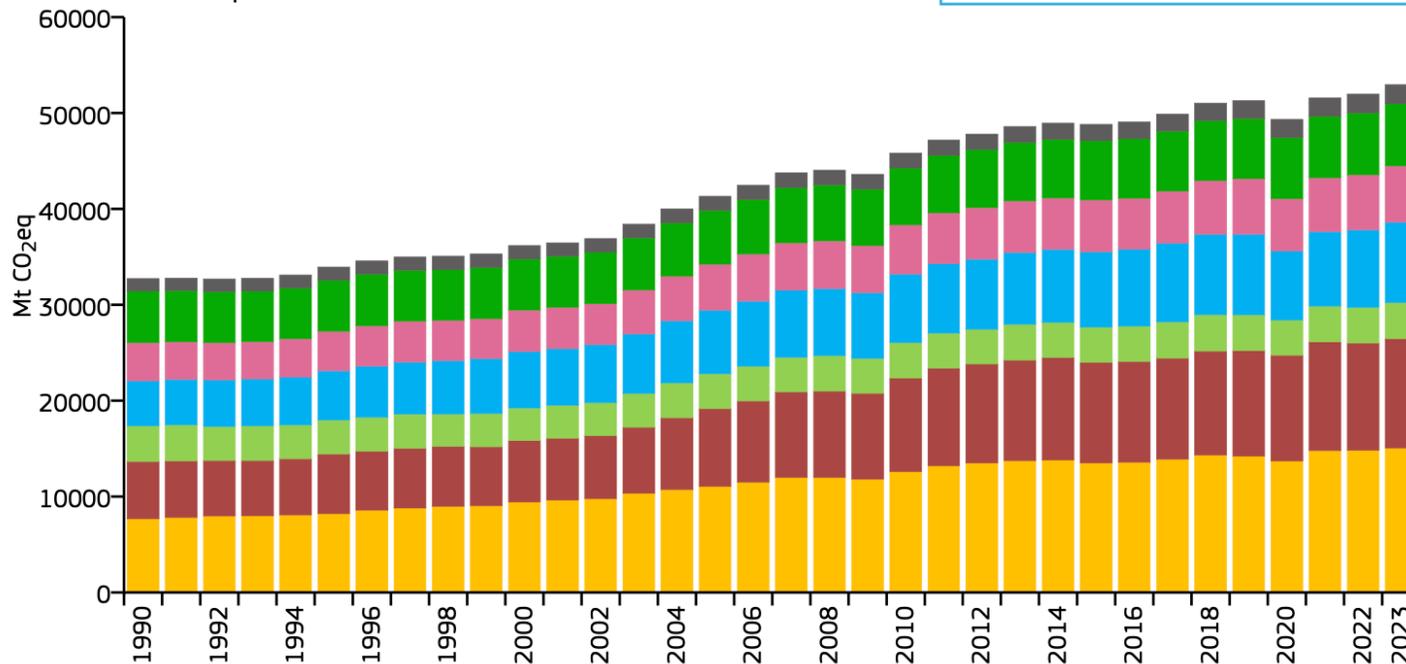

Global emissions of GHG

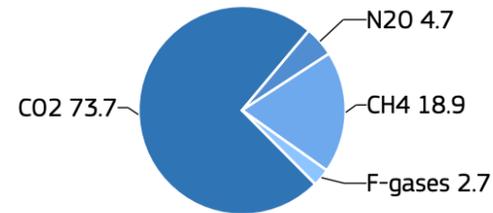

major sectors

GHG emissions by sector

- Power Industry
- Industrial Combustion and Processes
- Buildings
- Transport
- Fuel Exploitation
- Agriculture
- Waste

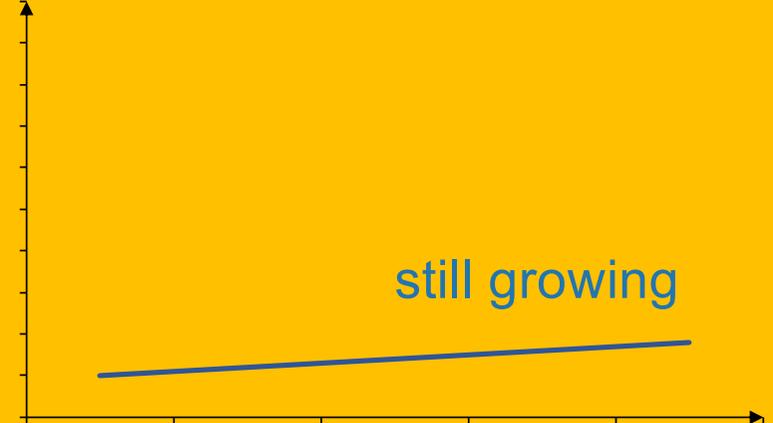

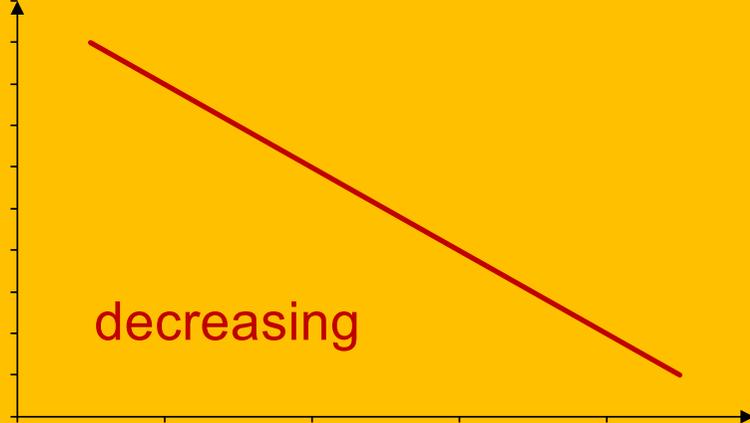

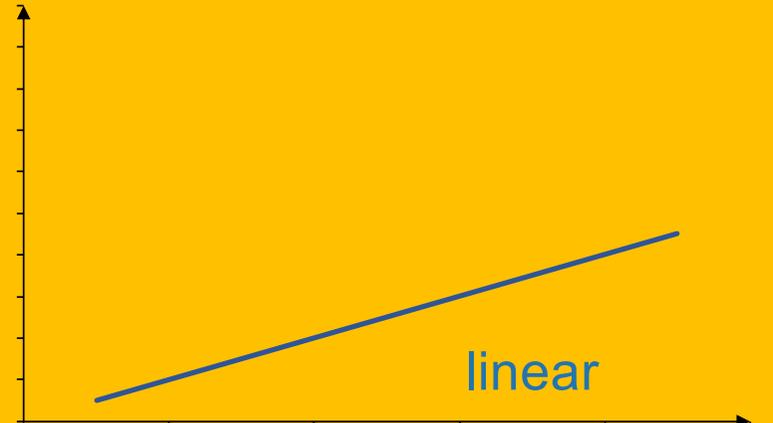

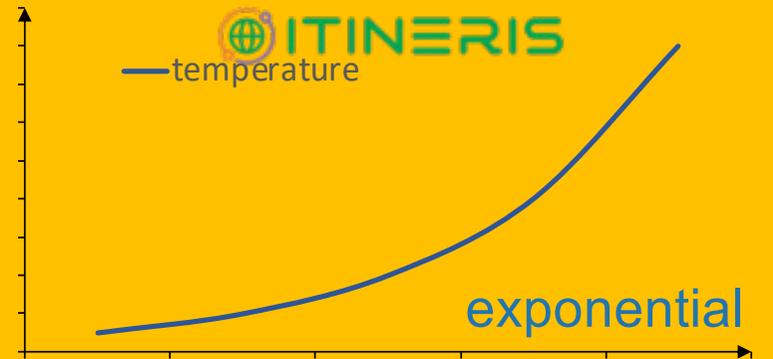

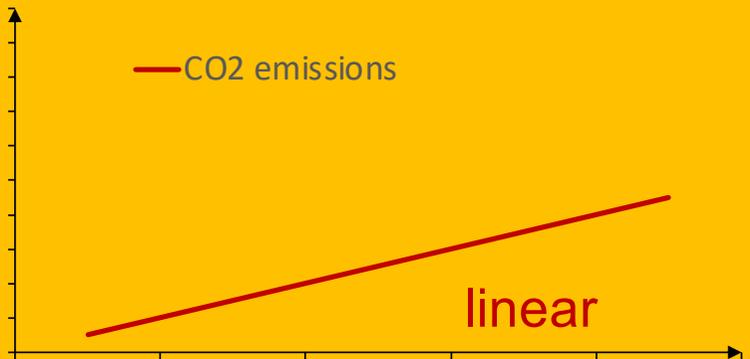

GHG % in 2023

CO₂ residence time, trends, Temperature

centuries to millennia

The evidence and effects are compelling

Global temperature rising

Ocean getting warmer

Ice sheets shrinking

Glaciers retreating

Snow cover decreasing

Sea level rising

Arctic sea ice declining

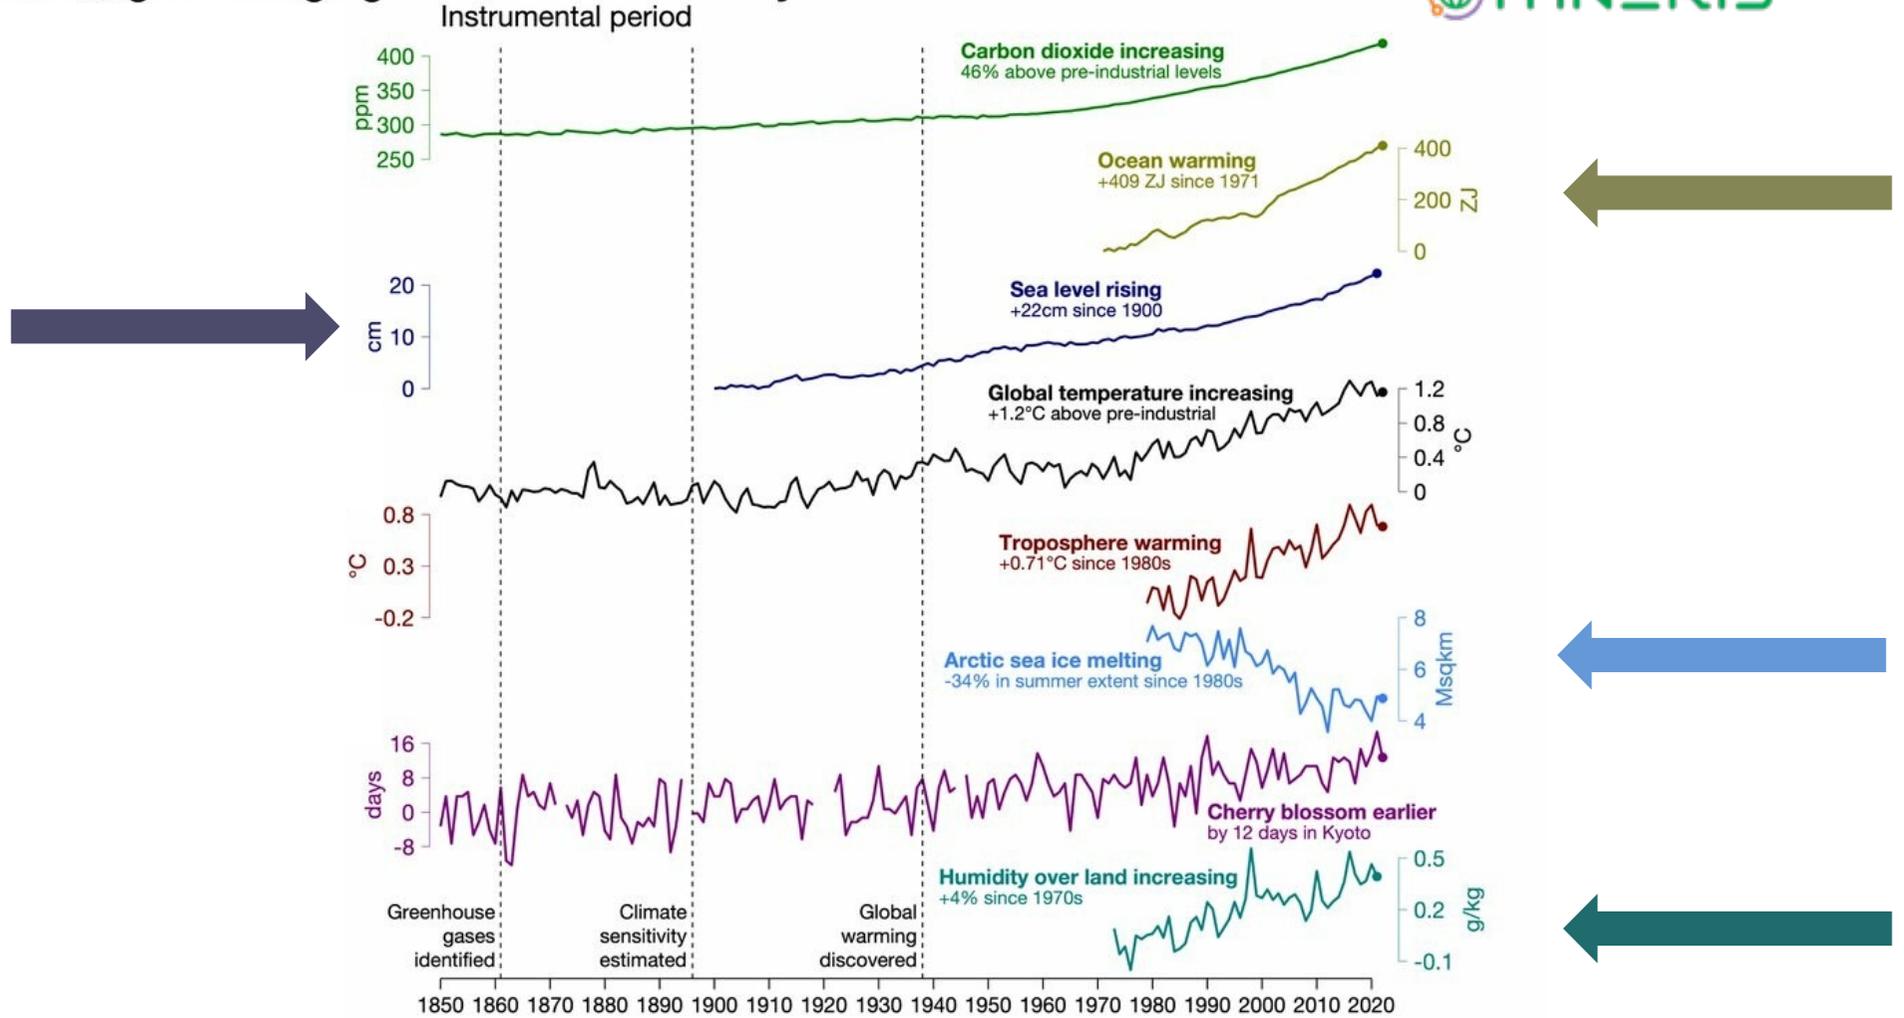

Ocean acidification increasing

Extreme events increasing

Changes emerging across the climate system

Ed Hawkins, 2025

c) Observed impacts and related losses and damages of climate change

HUMAN SYSTEMS

Water availability and food production	Physical water availability	
	Agriculture/crop production	
	Animal and livestock health and productivity	
	Fisheries yields and aquaculture production	
Health and wellbeing	Infectious diseases	
	Heat, malnutrition and harm from wildfire	
	Mental health	
	Displacement	
Cities, settlements and infrastructure	Inland flooding and associated damages	
	Flood/storm induced damages in coastal areas	
	Damages to infrastructure	
	Damages to key economic sectors	

Global

Africa

Asia

Australasia

Central & South America

Europe

North America

IPCC, Climate Change 2023: Synthesis Report

Key events in 2024

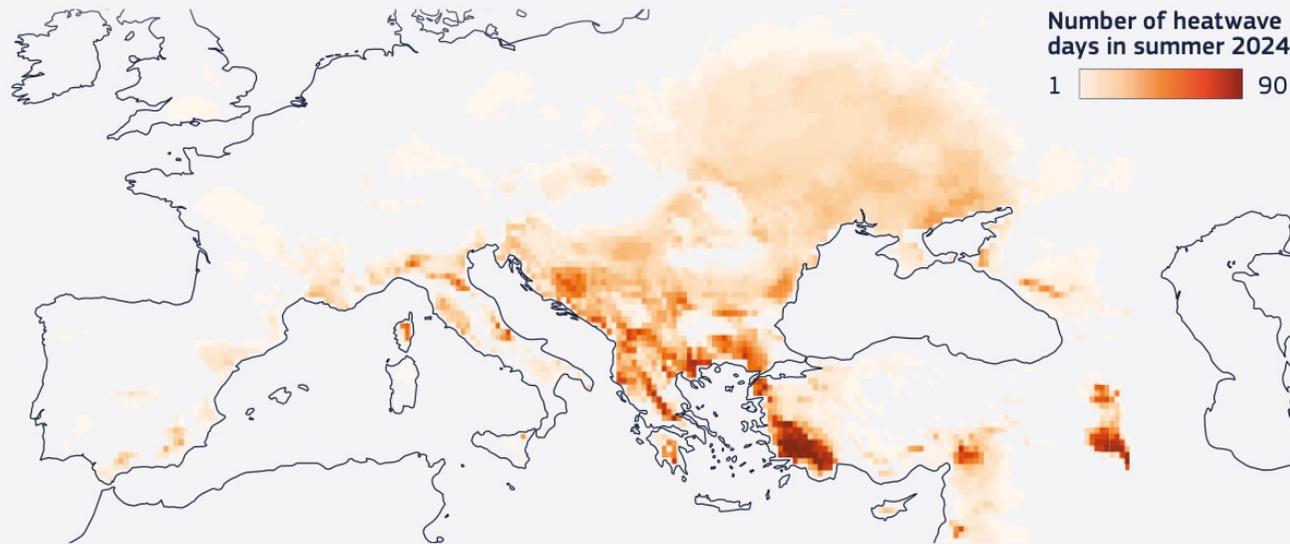

KEY EVENTS

- Heatwave
- Coldwave
- Wildfire
- Flood
- Drought
- Marine heatwave
- Storm
- Windstorm
- Climate resilience initiatives

Impacts*

*According to preliminary estimates for 2024 from the International Disaster Database.

43 of 97 days
had heatwaves

1 June to 5 September

Average of
55000
heat-related
deaths per
year

Mitigation and adaptation strategies

Mitigation: reducing GHG emissions

1. Transition to Renewable Energy
2. Energy Efficiency Improvements
3. Carbon Capture and Storage (CCS)
4. Sustainable Agriculture
5. Reforestation and Conservation

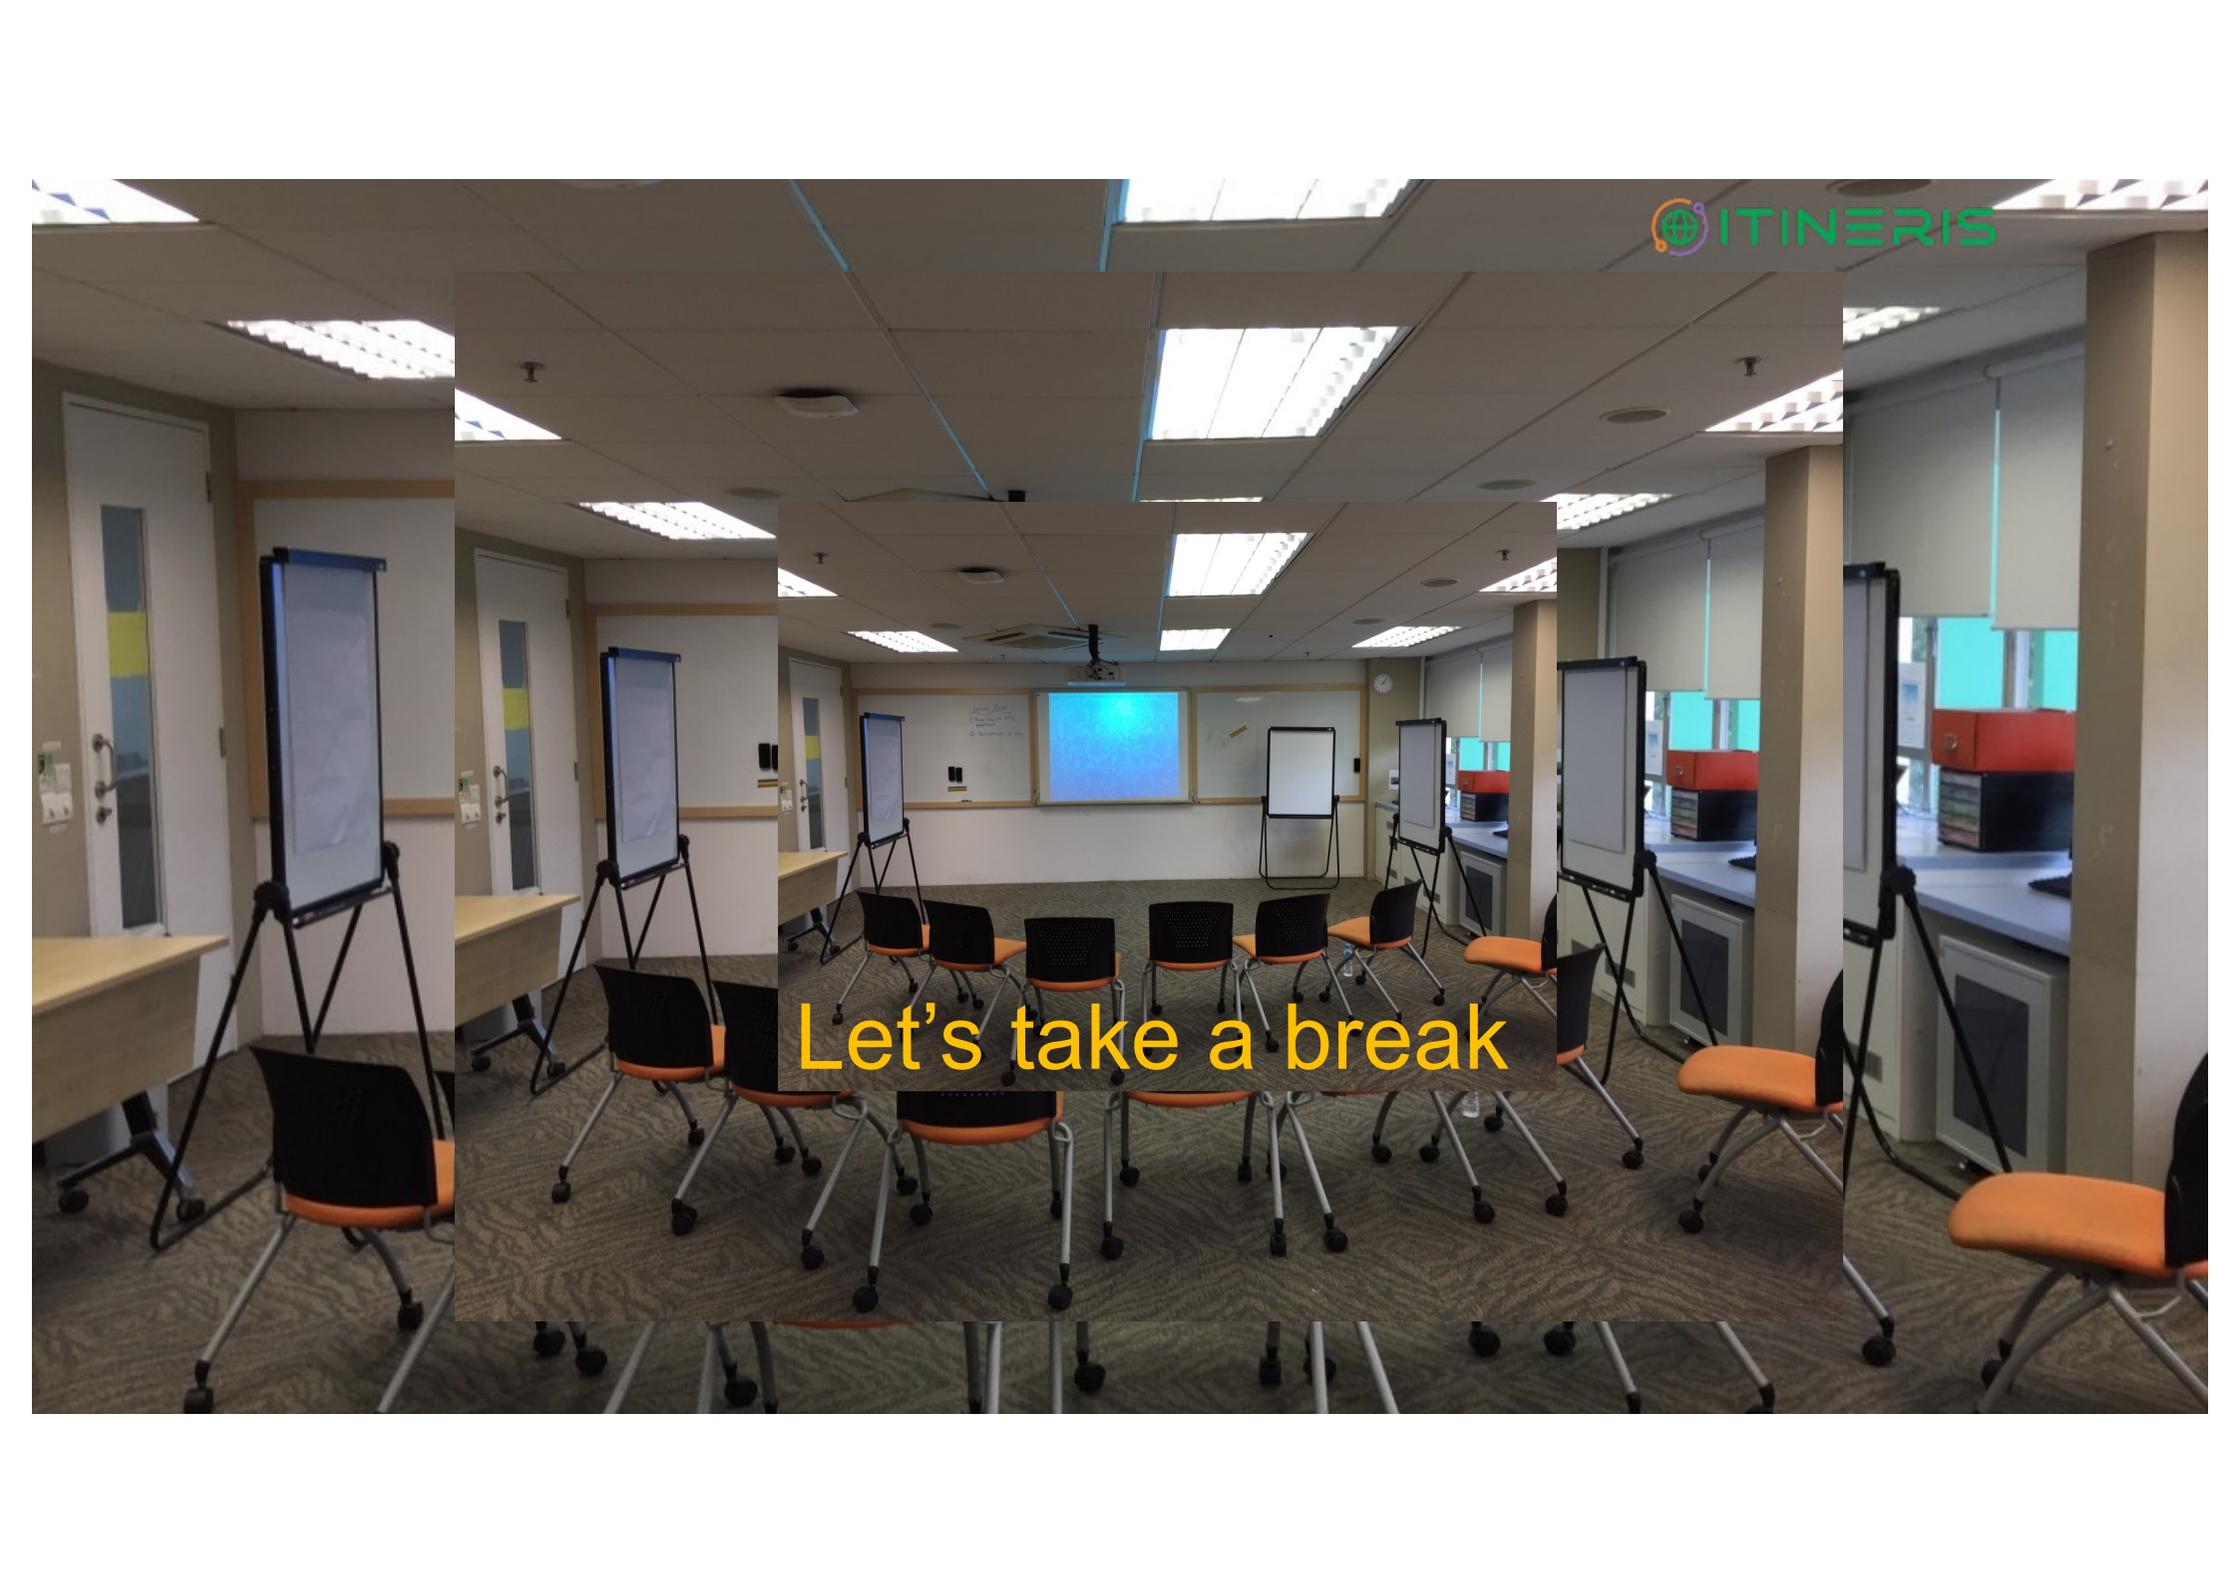

Adaptation: preparing for climate impacts

1. Infrastructure Resilience
2. Water Management
3. Disaster Preparedness
4. Climate-Smart Agriculture
5. Policy and Governance

Questions?

❁ What are the limitations of current scientific evidence in informing climate change policies?

A wide-angle photograph of a modern conference room. The room is carpeted with a grey and brown pattern. In the center, there is a circle of black office chairs with orange seats. Several flipcharts on stands are positioned around the room. In the background, there is a whiteboard and a large screen displaying a blue abstract image. The room has a drop ceiling with recessed lighting and a door on the left side.

Let's take a break

- ✿ Have you ever experienced a smoggy day or difficulty breathing in a polluted area?

"I'm sick of carbon dioxide getting all the attention. We're dangerous pollutants, too!"

Air quality

- Cleanliness of the air in our environment
- Presence and concentration of pollutants and other substances in the air that can affect human health, ecosystems, and the climate

Breathing Easy? Indoor & Outdoor Air Pollution

The two-way link between Air Pollution & Climate

- ✿ These two events are connected to both air quality and climate change. How?

CO₂
CH₄
N₂O

Climate and air quality impacts

Pollutant	Climate impact	Air quality impact
Carbon Dioxide (CO ₂)	Traps heat, main driver of climate change	Indirect—does not degrade air quality directly
Methane (CH ₄)	Strong greenhouse gas, contributes to ozone	Contributes to ground-level ozone (harmful)
Aerosols (PM _{2.5} and Black Carbon)	Absorbs or reflects sunlight (warming/cooling)	Major health hazard, reduces visibility
Ozone (O ₃)	Greenhouse gas in troposphere	Respiratory health impacts, smog formation
Sulphur dioxide (SO ₂) and nitrogen oxides (NO _x)	Forms aerosols that cool the atmosphere	Acid rain, worsens air pollution

Feedback loops and interactions

climate change can exacerbate air quality issues

Heatwaves, increased solar radiation and summertime temperatures:

- Increased levels of tropospheric ozone
- More frequent occurrences of stagnant air, trapping pollutants near the ground
- More frequent and intense wildfires
- Changes in precipitation and land use can lead to more frequent and intense dust storms
- Exacerbate pathologies related to bad air quality

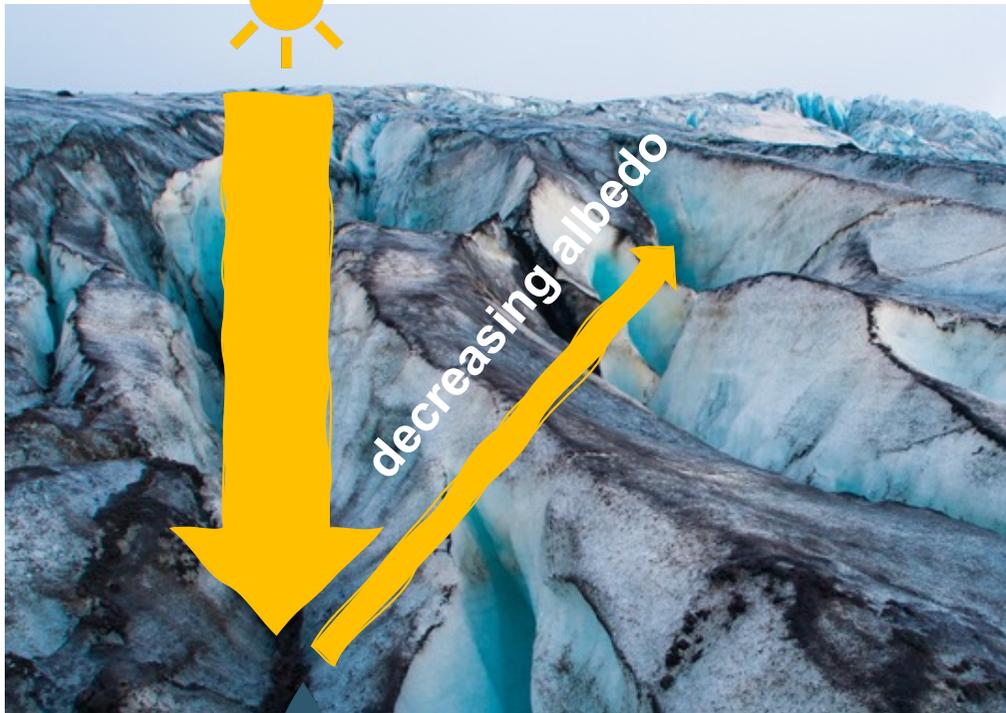

Feedback loops and interactions

poor air quality can impact climate

Black carbon on ice and snow

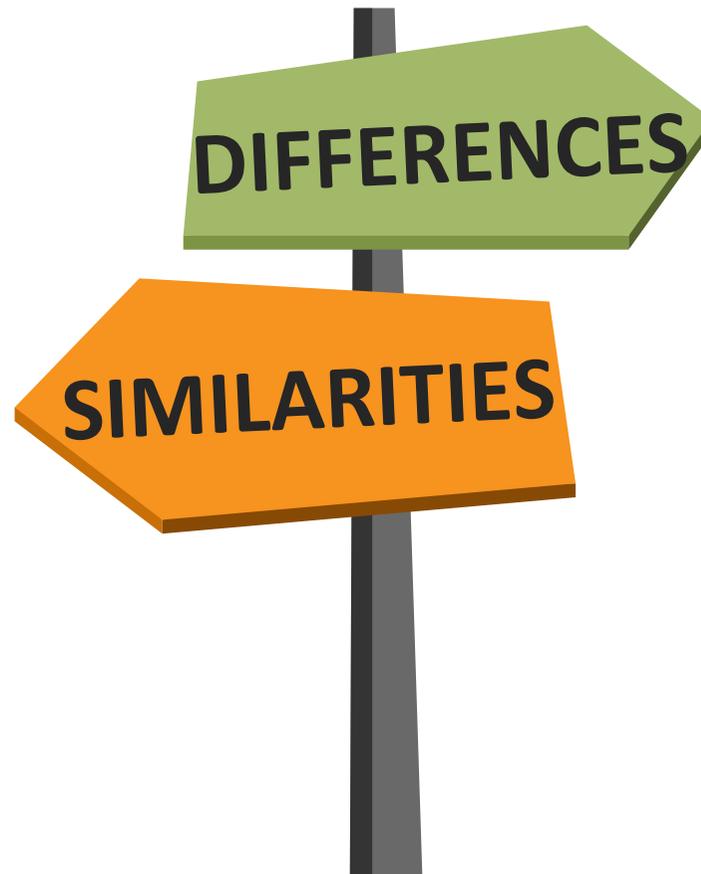

warming and melting

and also

- Increasing ozone as potent greenhouse gas
- Some aerosols, like sulfate particles, reflect sunlight, causing a cooling effect
- Aerosols can change cloud properties, influencing precipitation patterns
- High concentrations of air pollutants in urban areas can exacerbate the urban heat island effect
- Ground-level ozone can damage plant tissues, reducing their ability to photosynthesize and sequester carbon dioxide
-

Air pollutants and GHG

similarities and differences

✓ **HUMAN CAUSE**

Human activities contribute significantly to the emission of both

✓ **ENVIRONMENTAL AND HEALTH IMPACTS**

Both can have **detrimental effects**, although in different ways

✓ **REGULATION**

Governments and international bodies **regulate both** to mitigate their negative impacts

LIFETIME IN THE ATMOSPHERE

GHG have a **long** atmospheric lifespan, (CO₂ lasting hundreds to thousands of years); many APs have a **shorter** lifetime, ranging from hours to weeks

(IN)DIRECT EFFECTS

GHG's effects are mainly indirect through the mechanism of **climate change**; APs can have direct harmful effects on **human health and the environment** upon exposure

REGULATORY PURPOSE

GHGs Regulation often focuses on **reducing emissions**; APs Regulation typically focuses on **improving air quality**

Policy dilemma

fixing one problem can worsen another

- Reducing SO₂ emissions **helps air quality** but reduces aerosol cooling, which temporarily **accelerates warming**.
- Transition from diesel to natural gas, while **reducing NO_x** and PM, methane from extraction and transport of gas **can offset CO₂ reduction**.
- Using biomass instead of fossil fuel can **reduce CO₂ emissions**, but it **releases PM_{2.5}, NO_x** and VOCs.
- Transitioning to electric vehicles **reduces tailpipe emissions**, without cleaning the electricity production emissions of air pollutant **may increase**; **increased** brake and tire wear from heavier cars

Questions?

- ✿ Clean air is not a privilege; it's a right. How can we ensure future generations breathe safely?

THANKS!
